Fine Controls have been supplying process controls & instrumentation equipment since 1994, & now serves an ever expanding customer base, both in the UK & globally.

We offer a full range of valve & instrumentation products & services, with our product range representing leading technologies & brands:

**Flow:** Flow Meters & Transmitters, Flow Switches, Flow Control Valves & Batch Control Systems

**Temperature:** Temperature Probes & Thermowells, Temperature transmitters, Temperature Regulators & Temperature Displays

**Level:** Level Transmitters & Switches

**Pressure:** Pressure Gauges & Transmitters, Precision & High Pressure Regulators & I-P Converters, Volume boosters.

**Precision Pneumatics:** Pressure Regulators, I-P Converters, Volume Boosters, Vacuum Regulators

**Valves:** Solenoid & Pneumatic Valves, Control Valves & Positioners, Actuated Ball, Globe or Diaphragm Valves & Isolation Valves

**Services:** Repair, Calibration, Panel Build, System Design & Commissioning
Type 8692, 8693

1 THE OPERATING INSTRUCTIONS

The operating instructions describe the entire life cycle of the device. Keep these instructions in a location which is easily accessible to every user and make these instructions available to every new owner of the device.

**WARNING!**
The operating instructions contain important safety information!
Failure to observe these instructions may result in hazardous situations.
- The operating instructions must be read and understood.

1.1 Symbols

**DANGER!**
Warns of an immediate danger!
- Failure to observe the warning may result in a fatal or serious injury.

**WARNING!**
Warns of a potentially dangerous situation!
- Failure to observe the warning may result in serious injuries or death.

**CAUTION!**
Warns of a possible danger!
- Failure to observe this warning may result in a moderately severe or minor injury.

**CAUTION! (without hazard symbol)**
Warns of damage to property!
- Failure to observe the warning may result in damage to the device or the equipment.

designates additional significant information, tips and recommendations which are important for your safety and the proper function of the device.

refers to information in these operating instructions or in other documentation.

→ designates a procedure which you must carry out.
2 INTENDED USE

WARNING!

Incorrect use of the positioner Type 8692 and Type 8693 can be dangerous to people, nearby equipment and the environment.

- The device must not be used outside.
- The device must not be exposed to direct sunlight.
- Technical direct voltage must not be used as the power supply.
- During use observe the permitted data, the operating conditions and conditions of use specified in the contract documents and operating instructions, as described in chapter “System Description” - “Technical Data” in this manual and in the valve manual for the respective pneumatically actuated valve.
- The device may be used only in conjunction with third-party devices and components recommended and authorized by Bürkert.
- In view of the wide range of possible application cases, check whether the positioner is suitable for the specific application case and check this out if required.
- Correct transportation, correct storage and installation and careful use and maintenance are essential for reliable and problem-free operation.
- Use the positioner Type 8692 and Type 8693 only as intended.

2.1 Restrictions

If exporting the system/device, observe any existing restrictions.

2.2 Foreseeable Misuse

- The positioner Type 8692 and Type 8693 must not be used in areas where there is a risk of explosion.
- Do not introduce any aggressive or flammable media into the system’s media connections.
- Do not introduce any liquids into the media connections.
- Do not put any loads on the housing (e.g. by placing objects on it or standing on it).
- Do not make any external modifications to the device housings. Do not paint the housing parts or screws.
3 GENERAL SAFETY INSTRUCTIONS

These safety instructions do not make allowance for any
• contingencies and events which may arise during the installation, operation and maintenance of the devices.
• local safety regulations; the operator is responsible for observing these regulations, also with reference to the installation personnel.

⚠️ DANGER!

Danger – high pressure!
• There is a serious risk of injury when reaching into the equipment.
• Before loosening the lines and valves, turn off the pressure and vent the lines.

Risk of electric shock!
There is a serious risk of injury when reaching into the equipment.
• Before starting work, always switch off the power supply and safeguard to prevent re-activation!
• Observe applicable accident prevention and safety regulations for electrical equipment!

⚠️ WARNING!

Unintentional activation or non-permitted impairment may cause general hazardous situations through to physical injury.
• Take appropriate measures to prevent the equipment from being accidentally actuated!

Hazardous situations can arise during installation and maintenance work.
• This work may be carried out by authorized technicians only and with the appropriate tools!
• After an interruption in the power supply or pneumatic supply, ensure that the process is restarted in a defined or controlled manner!

⚠️ CAUTION!

The general rules of technology apply to applications planning and operation of the device!
Failure to observe these rules may result in injuries and/or damage to the device, and possibly its environment as well.
• Observe the general rules of technology!

⚠️ CAUTION!

Electrostatic sensitive components / modules!
• The device contains electronic components which react sensitively to electrostatic discharge (ESD). Contact with electrostatically charged persons or objects is hazardous to these components. In the worst case scenario, they will be destroyed immediately or will fail after start-up.
• Observe the requirements in accordance with EN 100 015 – 1 to minimize or avoid the possibility of damage caused by sudden electrostatic discharge!
• Also ensure that you do not touch electronic components when the power supply voltage is present!

The positioners Type 8692 and Type 8693 were developed with due consideration given to the accepted safety rules and are state-of-the-art. However, dangers can still arise.
Operate the device only when it is in perfect condition and in accordance with the operating instructions.
Failure to observe these instructions and unauthorized tampering with the device release us from any liability and also invalidate the warranty covering the devices and accessories!
4 GENERAL INFORMATION

4.1 Scope of supply
Check immediately upon receipt of delivery that the contents are not damaged and that they correspond to the type and quantity as indicated on the delivery note or packing list.
Generally this consists of:
Pneumatically actuated valve of Type 2300 or 2103 with attached positioner, the operating instructions for the positioner and for the valve with pneumatic drive.

⚠️ For the multipole version of the positioner we will provide you with cable connectors as suitable accessories.

If there are any discrepancies, please contact us immediately.

Contact addresses can be found on the final pages of these operating instructions.

And also on the internet at:
www.burkert.com ➔ Bürkert ➔ Company ➔ Locations

4.2 Warranty terms
This document does not offer any form of warranty. Please refer to our general terms of sales and business. The warranty is only valid if the positioner Type 8692 and Type 8693 is used as intended in accordance with the specified application conditions.

⚠️ The warranty extends only to defects in the positioners Type 8692 and Type 8693 and their components.
We accept no liability for any kind of consequential damage which could occur due to failure or malfunction of the device.

4.3 Master code
Operation of the device can be locked via a freely selectable user code. In addition, there is a non-changeable master code with which you can perform all operator control actions on the device. This 4-digit master code can be found in the Appendix of these operating instructions in the chapter entitled Master code.
If required, cut out the code and keep it separate from these operating instructions.

4.5 Information on the Internet
The operating instructions and data sheets for Type 8692 and Type 8693 can be found on the Internet at:
www.burkert.com ➔ Documentation ➔ manuals / data sheets ➔ Type 8692 or Type 8693

There is also complete documentation on CD. The complete operating instructions can be ordered by quoting the following identification number: 806 169

1 FUNCTION OF THE POSITIONER AND COMBINATION WITH VALVE TYPES

Positioners Type 8692 and Type 8693 are electropneumatic positioner for pneumatically actuated control valves with single-actuating or double-actuating actuators.

Together with the pneumatic actuator the positioner forms an optical and functional unit.

The control valve systems can be used for a wide range of control tasks in fluid technology and, depending on the application conditions, different process valves belonging to series 2300 or 2103 from the Bürkert range can be combined with the positioner. Angle-seat valves, diaphragm valves or ball valves fitted with a control cone are suitable.

Fig. 1 shows an overview of the possible combinations of positioner and different pneumatically actuated valves. Different actuator sizes and valve nominal widths, not illustrated here, are available for each type. More precise specifications can be found on the respective data sheets. The product range is being continuously expanded.

1.1 Models of the positioner

The positioner is available in 2 versions:

**Type 8692 - Positioner with positioning control**

The position of the actuator (stroke) is regulated according to the position set-point value. The position set-point value is specified by an external uniform signal (or via field bus).

**Type 8693 - Positioner with process control**

The positioner is linked to a control circuit. The position set-point value of the valve is calculated from the process set-point value and the actual process value via the control parameters (PID controller). The process set-point value can be set by an external signal.
Pneumatically actuated piston actuators and rotary actuators can be used as a actuator. Both single-acting and double-acting actuators are offered in combination with the positioner. For single-acting actuators, only one chamber is aerated and deaerated during actuation. The generated pressure works against a spring. The piston moves until there is an equilibrium of forces between compressive force and spring force. For double-acting actuators the chambers on both sides of the piston are pressurised. In this case, one chamber is aerated when the other one is deaerated and vice versa. In this design, no spring is installed in the actuator.

2 STRUCTURE OF THE POSITIONER

The positioners Type 8692 and Type 8693 consist of the micro-processor controlled electronics, the position measuring system and the control system.

The appliance is designed using three-wire technology. Operation of the positioner is controlled by four keys and a 128x64 dot matrix graphic display.

The pneumatic control system for single or double-acting actuators consists of two or four solenoid valves.

2.1 Representation

![Diagram of the positioner with labels for electrical, exhaust air, and supply pressure connections, along with a control module with display and keys.](image-url)

**Fig. 2: Structure**
2.2 Features

- **Models**
  for single-acting or double-acting valve actuators.

- **Position measuring system**
  Non-contact and therefore non-wearing position measuring system.

- **Microprocessor-controlled electronics**
  for signal processing, control and valve control.

- **Control module**
  Operation of the device is controlled by four keys. The 128x64 dot matrix graphics display enables you to display the set-point or actual value and to configure and parameterize via menu functions.

- **Control system**
  The control system consists of 2 solenoid valves for single-acting actuators or four solenoid valves for double-acting actuators. In single-acting actuators, one valve serves for the aeration and another for the deaeration of the pneumatic piston actuator. Double-acting actuators feature 2 valves for aeration and deaeration. The solenoid valves operate according to the rocker principle and are controlled with a PWM voltage via the controller. Doing so achieves a higher flexibility with regard to actuator volume and final control speed. On larger pneumatic actuators the solenoid valves feature diaphragm reinforcers to increase the maximum flow and therefore improve the dynamics.

- **Position feedback (optional)**
  One inductive proximity switch (initiator).
  When the valve reaches an upper or a lower position, this can be relayed e.g. to a PLC via binary outputs. By means of set-screws, the operator can change the initiators or limit positions.

- **Pneumatic interfaces**
  1/4” connections with different thread forms (G, NPT)
  Hose plug-in connection

- **Electrical interfaces**
  Multi-pole plug or cable gland

- **Body**
  The body of the positioner is protected from excessively high internal pressure, e.g. caused by leaks, by a pressure limiting valve.
2.3 Function diagram of the positioner with single-acting actuator

The black lines describe the function of the position controller (Type 8692). The process controller (Type 8693) includes the position controller and the functions which are illustrated in grey.
3 TYPE 8692 POSITIONER WITH POSITION CONTROLLER

The position measuring system records the current position (POS) of the pneumatic actuator. The position controller compares this actual position value with the set-point value (CMD), which is definable as norm signal. In case of a control deviation (Xd1), a pulse-width modulated voltage signal is sent to the control system as a manipulated variable. If there is a positive control difference in single-acting actuators, the air inlet valve is controlled via output B1. If the control difference is negative, the bleed valve is controlled via output E1. In this way the position of the actuator is changed until control difference is 0. Z1 represents a disturbance variable.

4 TYPE 8693 POSITIONER WITH PROCESS CONTROLLER

If the positioner is operated with process controller Type 8693, the aforementioned position control becomes the subordinate auxiliary control circuit; this results in a cascade control. The process controller in the main control circuit of the positioner has a PID function. The process set-point value (SP) is specified as set-point value and compared with the actual value (PV) of the process variable to be controlled. The position measuring system records the current position (POS) of the pneumatic actuator. The position controller compares this actual position value with the set-point value (CMD), which is determined by the process controller. In case of a control deviation (Xd1), a pulse-width modulated voltage signal is sent to the control system as a manipulated variable. If there is a positive control difference in single-acting actuators, the air inlet valve is controlled via output B1. If the control difference is negative, the bleed valve is controlled via output E1. In this way the position of the actuator is changed until control difference is 0. Z2 represents a disturbance variable.

7.3 Specifications of the Positioner

7.3.1 Operating Conditions

**CAUTION!**

If used outside, the device may be exposed to direct sunlight and temperature fluctuations which may cause malfunctions or leaks!

- The device must not be used outside.

Ambient temperature 0 - + 55 °C

Protection type IP 65 in accordance with EN 60529

(only if cables, plugs and sockets have been connected correctly)

7.3.2 Conformity with the following standards

(only if cables, plugs and sockets have been connected correctly)

7.3.3 Mechanical data

Dimensions see data sheet

Body material exterior: PPS, PC, VA, interior: PA 6; ABS

Sealing material NBR / EPDM

7.3.4 Electrical data

Connections cable entry (24 V DC) or multi-pole plug (Profibus DP, DeviceNet, 24 V DC)

Power supply 24 V DC ± 10 % max. residual ripple 10 %

Power input < 5 W

Input resistance 180Ω at 4 - 20 mA / 12 bit resolution

for actual value signal 17 kΩ at frequency, 0 – 1000 Hz / 1‰ of measured value

> 300 mVrms sine, square, triangle

PT 100 - 20 – + 220 °C, resolution < 0.1 °C

Input resistance 180 Ω at 0/4 - 20 mA / 12 bit resolution

for nominal value signal 19 kΩ at 0 - 5/10 V / 12 bit resolution

Protection class 3 in accordance with VDE 0580

Analogue position feedback max. current

for voltage output 0 – 5/10 V 10 mA

for current output 0/4 – 20 mA 560 Ω

Inductive proximity switches current limitation 100 mA

Binary outputs galvanically isolated

Current limiting 100 mA, output is clocked

Binary input galvanically isolated

0 – 5 V = log "0", 10 – 30 V = log "1"

input inverted accordingly

1 CONTROL AND DISPLAY ELEMENTS

The following chapter describes the control and display elements of the positioner. Further information on the control of the positioner can be found in the chapters entitled "Installation", “Start-up and operation of the position controller Type 8692" and “Start-up and operation of the process controller Type 8693”.

1.1 Control and display elements of the positioner

The positioner features a 4-key control panel and a 128x64 dot matrix graphics display as a display element.

![Description of the control module](image_url)
1.2 Configuration of the keys

The assignment of the 4 keys on the control panel differs depending on the operating status (AUTOMATIC / MANUAL) or operating level (Operate process / Parameterization and Configuration) of the positioner. The configuration of the keys is represented in the lower grey bar on the display panel.

The description of the operating statuses (AUTOMATIC / MANUAL) and the operating levels (Operate process / Parameterization and Configuration) can be found in the chapters entitled “Operating modes” and “Operating levels”.

</tr>
</tbody>
</table>

* Unit depending on process actual value.
# 2 OPERATING MODES

## 2.1 Operating state

The positioner has 2 operating states: AUTOMATIC and MANUAL mode.

**AUTOMATIC**

Normal controller mode is implemented and monitored in AUTOMATIC operating state. 
(A bar runs along the upper edge of the display).

**MANUAL**

In MANUAL operating state the valve can be opened and closed manually via the arrow key (OPN/CLS).  
(No bar running along the upper edge of the display).

The right selection key can be used to switch between the two operating states AUTOMATIC (AUTO) and MANUAL (MANU).

⚠️ It is possible to switch from AUTOMATIC to MANUAL mode only on the POS and CMD displays and also on the PV display for Type 8693. On the SP display only for external process set-point value (see also Configuration of the keys).

## 2.2 AUTOMATIC Operating State for Type 8692

(Bar runs along the upper edge of the display from left to right)

Normal controller mode is implemented and monitored in AUTOMATIC operating state.

The arrow keys can be used to switch between the following displays in AUTOMATIC operating state:

<table>
<thead>
<tr>
<th>Display</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>POS %</td>
<td>Display of actual position of the valve actuator (0 - 100%)</td>
</tr>
<tr>
<td>CMD %</td>
<td>Display of nominal position of the valve actuator or display of nominal position of the valve actuator after rescaling by possibly activated split range function or correction characteristic (0 - 100%)</td>
</tr>
<tr>
<td>TEMP °C</td>
<td>Internal temperature in the housing of the positioner (°C)</td>
</tr>
<tr>
<td>INPUT mA</td>
<td>Input signal for nominal position (0 - 5/10 V or 0/4 – 20 mA)</td>
</tr>
</tbody>
</table>
### 2.3 AUTOMATIC Operating State for Type 8693

(Bar runs along the upper edge of the display from left to right)

Normal controller mode is implemented and monitored in AUTOMATIC operating state.

If the \textit{P.CONTROL} additional function is activated for Type 8693, it is possible to switch between the following states in AUTOMATIC operating state:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Display</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="pos.png" alt="POS" /></td>
<td>XXX</td>
<td>Display of actual position of the valve actuator (0 - 100%)</td>
</tr>
<tr>
<td><img src="cmd.png" alt="CMD" /></td>
<td>XXX</td>
<td>Display of nominal position of the valve actuator or display of nominal position of the valve actuator after rescaling by possibly activated split range function or correction characteristic (0 - 100%)</td>
</tr>
<tr>
<td><img src="temp.png" alt="TEMP" /></td>
<td>XXX</td>
<td>Internal temperature in the housing of the positioner (°C)</td>
</tr>
<tr>
<td><img src="pv.png" alt="PV" /></td>
<td>XXX</td>
<td>Process actual value</td>
</tr>
<tr>
<td><img src="sp.png" alt="SP" /></td>
<td>XXX</td>
<td>Process set-point value</td>
</tr>
</tbody>
</table>

If the \textit{P.CONTROL} additional function is not active, the displays are represented as under Type 8692.

*INPUT is indicated here if the internal nominal value default has been selected (P.CONTROL - SP-INPUT - internal). MANU is indicated here if the external nominal value default has been selected (P.CONTROL - SP-INPUT - external).*
2.4 MANUAL Operating State

(no bar running along upper edge of display)

In MANUAL operating state the valve can be opened and closed manually via the arrow keys.

Meaning of the arrow keys in MANUAL operating state:

<table>
<thead>
<tr>
<th>Press the up arrow key:</th>
<th>Press the down arrow key:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aerate the actuator</td>
<td>Deaerate the actuator</td>
</tr>
<tr>
<td>Control function A (SFA):</td>
<td>Valve opens</td>
</tr>
<tr>
<td>Control function B (SFB):</td>
<td>Valve closes</td>
</tr>
<tr>
<td>Control function I (SFI):</td>
<td>Connection 2.1 aerated</td>
</tr>
<tr>
<td>Control function A (SFA):</td>
<td>Valve closes</td>
</tr>
<tr>
<td>Control function B (SFB):</td>
<td>Valve opens</td>
</tr>
<tr>
<td>Control function I (SFI):</td>
<td>Connection 2.2 aerated</td>
</tr>
</tbody>
</table>

SFA: Actuator closes by spring force
SFA: Actuator opens by spring force
SFI: Actuator double-acting
3 OPERATING LEVELS

The menu structure in the control module of the positioner contains 2 operating levels:

- **Level 1:** Operate process
  - Operating mode AUTOMATIC → Process / input data displayed
  - MANUAL → Actuator opened and closed manually

- **Level 2:** Parameterization and Configuration
  - Input operating parameters
  - Supplement the menu with optional menu options

### 3.1 Switching between the Operating Levels

> If AUTOMATIC operating mode has been set when switching from level 1 (Operate process) to level 2 (Parameterization and Configuration), the process continues running while positioner settings are implemented on level 2.

→ To switch from level 1 (Operate process) to level 2 (Parameterisation), press the selection key on the left (MENU) for approx. 3 seconds. During these 3 seconds (Countdown) 2 bars converge (see Fig. 3).

→ To switch back from level 2 (Parameterization and Configuration) to level 1 (Operate process), press the selection key on the left (EXIT).

---

1 INSTALLING THE VALVE

1.1 Safety Instructions

DANGER!
Danger – high pressure in the equipment!
There is a serious risk of injury when reaching into the equipment.
• Before loosening the lines and valves, turn off the pressure and vent the lines.

WARNING!
Danger - improper installation!
Improper installation may result in injuries as well as damage to the device and the area around it.
• Fluid and electrical installations may be carried out by authorized technicians only and with the appropriate tools!

Danger due to unintentional activation of the equipment!
Unintentional activation of the equipment during installation may result in injuries and damage.
• Take appropriate measures to prevent the equipment from being unintentionally activated.

The positioner dimensions and the different complete device models consisting of positioner, pneumatic actuator and valve can be found on the data sheet.

1.2 installation of the process valve
Thread type and dimensions can be found in the corresponding data sheet.
→ Connect the valve according to the operating instructions for the valve.

2 ROTATING THE ACTUATOR MODULE

The actuator module cannot be rotated unless there are straight seat and slanted seat valves!

Following installation of the process valve, if the positioner display is only partially visible or the connection cables or hoses cannot be fitted properly, the actuator module (positioner and actuator) can be rotated into a position suitable for the connection.

Only the entire actuator module can be rotated. The positioner cannot be rotated contrary to the actuator.

Procedure:
→ Clamp the valve housing in a retaining jig (only possible if the process valve has not yet been installed).
→ Using a suitable open-end wrench, counter the wrench flat on the pipe.
→ Fit special key* exactly into the key contour on the underside of the actuator module.

WARNING!
Risk of injury from discharge of medium and pressure!
If the direction of rotation is wrong, the housing interface may become detached.
Do not rotate the actuator module in a clockwise direction!

→ Rotate the actuator module in an anti-clockwise direction into a position suitable for the pneumatic connection.

* The special key is available from your Bürkert sales office.
## 3 FLUID CONNECTION OF THE POSITIONER

### DANGER!

**Danger – high pressure in the equipment!**
There is a serious risk of injury when reaching into the equipment.
- Before loosening the lines and valves, turn off the pressure and vent the lines.

### WARNING!

**Danger - improper installation!**
Improper installation may result in injuries as well as damage to the device and the area around it.
- Fluid and electrical installations may be carried out by authorized technicians only and with the appropriate tools!

**Danger due to unintentional activation of the equipment!**
Unintentional activation of the equipment during installation may result in injuries and damage.
- Take appropriate measures to prevent the equipment from being unintentionally activated.

---

**Procedure:**

→ Apply the supply pressure to connection “1” (3 – 7 bar; instrument air, free of oil, water and dust)
→ Attach the exhaust air line or the silencer to connection “3”

Keep the adjacent supply pressure **always** at least 0.5 – 1 bar above the pressure which is required to move the pneumatic actuator to its end position. This ensures that the control behavior is not extremely negatively affected in the upper stroke range on account of too little pressure difference.

During operation keep the fluctuations of the supply pressure as low as possible (max. ±10 %). If fluctuations are greater, the control parameters measured with the X.TUNE function are not optimum.
4 ELECTRICAL CONNECTION - MULTIPOLE PLUG MODEL

**DANGER!**

Danger - electrical voltage in the equipment!
There is a serious risk of injury when reaching into the equipment.
- Before starting work, always switch off the power supply and safeguard to prevent re-activation!

**WARNING!**

Danger - improper installation!
Improper installation may result in injuries as well as damage to the device and the area around it.
- Fluid and electrical installations may be carried out by authorized technicians only and with the appropriate tools!

Danger due to unintentional activation of the equipment!
Unintentional activation of the equipment during installation may result in injuries and damage.
- Take appropriate measures to prevent the equipment from being unintentionally activated.

Using the 4 - 20 mA nominal value input
If the operating voltage of one positioner device fails in a series connection of several devices, the input of the failed positioner device becomes highly resistive. As a result, the 4 - 20 mA standard signal fails. In this case please contact Bürkert Service directly.

If PROFIBUS DP or DeviceNet: The designation of the multipole plugs and sockets and the contacts can be found in the respective chapters.

4.1 Type 8692 - Designation of the multipole plugs and the contacts

* Can be adjusted by software (see chapter entitled “Specifying the Basic Settings”)

For reasons of wire compensation connect the Pt 100 sensor via 3 wires. Always bridge Pin 3 and Pin 4 on the sensor.

When the power supply voltage is applied, the positioner is operating.

→ Now implement the required basic settings and activate automatic adjustment of the positioner as described in the chapter entitled "Initial Start-up" or "Starting and Setting Up the Process Controller Type 8693".
5 ELECTRICAL CONNECTION - TERMINAL MODEL FOR CABLE GLAND

**DANGER!**
Danger - electrical voltage in the equipment!
There is a serious risk of injury when reaching into the equipment.
- Before starting work, always switch off the power supply and safeguard to prevent re-activation!

**WARNING!**
Danger - improper installation!
Improper installation may result in injuries as well as damage to the device and the area around it.
- Fluid and electrical installations may be carried out by authorized technicians only and with the appropriate tools!

Danger due to unintentional activation of the equipment!
Unintentional activation of the equipment during installation may result in injuries and damage.
- Take appropriate measures to prevent the equipment from being unintentionally activated.

**Using the 4-20 mA nominal value input**
If the operating voltage of one positioner device fails in a series connection of several devices, the input of the failed positioner device becomes highly resistive. As a result, the 4-20 mA standard signal fails. In this case please contact Bürkert Service directly.

5.1 Terminal board of the positioner with screw-type terminals and switches

The connection terminals can be accessed by removing the cover from the cable glands. To do this, unscrew the 4 screws.

- Connect the positioner accordingly:
  - **Type 8692:** see chapter entitled “Terminal Assignment for Cable Gland - Position Controller Type 8692”
  - **Type 8693:** see chapter entitled “Terminal Assignment for Cable Gland - Process Controller Type 8693”
5.2 Terminal Assignment for Cable Gland - Position Controller Type 8692

</tbody>
</table>

For reasons of wire compensation connect the Pt 100 sensor via 3 wires.
Always bridge Terminal 3 and Terminal 4 on the sensor.

When the power supply voltage is applied, the positioner is operating.
Now implement the required basic settings and activate automatic adjustment of the positioner as described in the chapter entitled “Initial Start-up” or “Starting and Setting Up the Process Controller Type 8693”.

* Can be adjusted by software (see chapter entitled “Specifying the Basic Settings”)
** The switch is situated on the terminal board of the positioner (see Fig. 4)
6 INITIAL START-UP

This section enables you to start up the positioner quickly in order to perform a function check. Additional functions which are not required are not dealt with in this context.

6.1 Safety Instructions

**DANGER!**

Danger – high pressure in the equipment!
There is a serious risk of injury when reaching into the equipment.
• Before loosening the lines and valves, turn off the pressure and vent the lines.

**WARNING!**

Danger - improper installation!
Improper installation may result in injuries as well as damage to the device and the area around it.
• Fluid and electrical installations may be carried out by authorized technicians only and with the appropriate tools!

Danger due to unintentional activation of the equipment!
Unintentional activation of the equipment during installation may result in injuries and damage.
• Take appropriate measures to prevent the equipment from being unintentionally activated.

6.2 Installation

→ Before start-up, carry out fluid and electrical installation of the positioner and valve.
When the operating voltage is applied, the positioner is operating and is in the AUTOMATIC operating state.

6.3 Specifying the Basic Settings

The basic settings of the positioner are implemented at the factory.

Before the positioner can undergo a function check, the unit input signal (standard signal) must still be set following installation of the device and the X.TUNE function run to adjust the device to local conditions.

To specify the basic settings, switch from the process operating level to the configuration level.

→ Hold down the left selection key (MENU) for approx. 3 seconds (countdown: two bars converge on the display). Then the main menu (MAIN) is indicated on the display together with the menu options which can be individually marked via the arrow keys and then selected via the right selection key (ENTER).
6.3.1 Setting the Input Signal (Standard Signal):

→ Using the arrow keys, mark the INPUT menu option in the main menu and then press the right selection key (ENTER) to enter the INPUT submenu.
→ Using the arrow keys, mark the input signal (4-20mA, 0-20mA,...).
→ Press the right selection key (SELEC) to select the input signal (dot is marked).
→ To leave the submenu, press the left selection button (EXIT).
→ To leave the main menu, press the left selection button (EXIT) again.

You have to leave the main menu by pressing the left selection button (EXIT) before the modified data is saved in the memory (EEPROM). During the save process the message “SAVE EEPROM” is indicated on the display.

6.3.2 Running the Automatic Adjustment X.TUNE:

An exact description of the X.TUNE function can be found in the chapters entitled “Start-up and Operating the Position Controller Type 8692”

WARNING!

While the X.TUNE function is running, the valve automatically moves from its current position!
- Never run X.TUNE while a process is running!
- Take appropriate measures to prevent the equipment from being accidentally actuated!

CAUTION!

Avoid maladjustment of the controller due to an incorrect supply pressure or applied operating medium pressure!
- Run X.TUNE whenever the supply pressure (= pneumatic auxiliary energy) is available during subsequent operation.
- Run the X.TUNE function preferably without operating medium pressure to exclude interference caused by flow forces.

→ To enter the main menu, hold down the left selection button (MENU) for approx. 3s (countdown on the display).
→ Using the arrow buttons, mark the X.TUNE menu option.
→ To start the automatic adjustment X.TUNE, hold down the right selection button (RUN) for approx. 3s (countdown on the display).

While the automatic adjustment is running, messages on the progress of the X.TUNE (e.g. “TUNE #1....”) are indicated on the display.

When the automatic adjustment completes, the message “X.TUNE READY” is indicated.
→ Press any key to return to the main menu.
→ To leave the main menu, press the left selection button (EXIT).

You have to leave the main menu by pressing the left selection button (EXIT) before the modified data is saved in the memory (EEPROM). During the save process the message “SAVE EEPROM” is indicated on the display.

4.3 Auxiliary functions

4.3.1 **CHARACT** Select the transfer characteristic between input signal (position set-point value) and stroke.

4.3.2 **CUTOFF** Sealing function for the position controller Type 8692.

4.3.3 **DIR.CMD** Effective sense of direction of the position controller set-point value.

4.3.4 **DIR.ACT** Effective sense of direction of the actuator.

4.3.5 **SPLTRNG** Signal split range.

4.3.6 **X.LIMIT** Limits the mechanical stroke range.

4.3.7 **X.TIME** Limiting the control speed.

4.3.8 **X.CONTROL** Parameterisation of the position controller.

4.3.9 **SECURITY** Code protection for the settings.

4.3.10 **SAFEPOS** Input the safety position.

4.3.11 **SIG-ERROR** Configuration of signal level fault detection.

4.3.12 **BINARY-IN** Activation of the binary input.

4.3.13 **OUTPUT** (option) Configuring the outputs.

4.3.14 **CAL.USER** Calibrating the actual value display and the inputs for the position set-point value.

4.3.15 **SET.FACTORY** Resetting to the factory settings.

4.3.16 **SER. I/O** Settings of the serial interface.

4.3.17 **EXTRAS**

4.3.18 **SERVICE**
1 SAFETY INSTRUCTIONS

⚠️ DANGER!
Danger – high pressure in the equipment!
There is a serious risk of injury when reaching into the equipment.
• Before loosening the lines and valves, turn off the pressure and vent the lines.

⚠️ WARNING!
Danger - improper installation!
Improper installation may result in injuries as well as damage to the device and the area around it.
• Fluid and electrical installations may be carried out by authorised technicians only and with the appropriate tools!

Danger due to unintentional activation of the equipment!
Unintentional activation of the equipment during installation may result in injuries and damage.
• Take appropriate measures to prevent the equipment from being unintentionally activated.
2 STARTING UP AND INSTALLING THE POSITION CONTROLLER TYPE 8692

Before starting up the device, carry out the fluid and electrical installations as described in the chapter entitled “Installation”.

2.1 Description of the procedure

When the operating voltage has been switched on, the positioner is at the process operating level in the AUTOMATIC operating state.

To specify the basic settings, you must switch to the configuration level:

Hold down the left selection key (MENU) for approx. 3 seconds (wait for countdown on display).

Then the main menu is indicated on the display (MAIN).

Press the arrow keys to switch between the main menu options and select a menu option with the right selection key (ENTER/RUN).

Depending on the function, a menu sub-option or a selection screen is indicated on the display.

Press the arrow keys to switch between these sub-options and select the required settings. Press the right selection key (SELECT/ENTER) to confirm the selection (the point after the selected parameter is now marked). Return to the main menu by pressing the left selection key (EXIT).

To save the changed settings, you must leave the configuration level by pressing the right selection key (EXIT).

You are back at the process operating level.

Only when you leave the configuration level by pressing the right selection key, are the changed parameters and settings saved (“save EEPROM”).

### 2.3 Specifying the Basic Settings

When starting up the positioner for the first time, implement the following basic settings:

- Specify the selected unit signal input for the set-point value default (INPUT)
  
  (4 – 20 mA, 0 – 20 mA, 0 – 10 V or 0 – 5 V).

- Start automatic adjustment of the position controller to the particular operating conditions (X.TUNE).

*The exact description of the functions INPUT and X.TUNE can be found in the chapter entitled “Description of the functions of the main menu”.

**The basic settings for the positioner are implemented at the factory. During start-up, however, it is essential to input the unit signal (INPUT) and run X.TUNE. Using the X.TUNE function, the positioner automatically determines the optimum settings for the current operating conditions.

If the X.CONTROL is in the main menu while the auxiliary function X.TUNE is running, the position controller dead band DBND is determined automatically depending on the friction behaviour of the actuator (see chapter entitled “Auxiliary functions - X.CONTROL”)

* preset at the factory
** option only
2.4 Description of the basic functions in the main menu

2.4.1 Main menu of the positioner

**Fig. 1: Operating structure of basic settings**

* ACTUATOR: the operating mode of the actuator has been preset at the factory.

** ADD.FUNCTION is not required for the initial start-up.
2.4.2 Inputting the operating mode of the pneumatic actuator

ACTUATOR - Operating mode of the actuator

The operating mode of the pneumatic valve actuator used in combination with the positioner can be input in this menu option.

The operating mode of the actuator has been preset at the factory.

SF A and SF B: single-acting
SF L: double-acting

The control function of the actuator can be found on the rating plate.

\[ \text{Fig. 2: Operating structure of ACTUATOR} \]

2.4.3 Inputting the input signal

INPUT - Selected unit input signal

→ Under this menu option input the unit signal used for the set-point value.

\[ \text{Fig. 3: Operating structure of INPUT} \]
2.4.4 Automatic adjustment (autotune) of the position controller

X.TUNE - Autotune for position controller

WARNING!
While the X.TUNE function is running, the valve automatically moves from its current position!

- Never run X.TUNE while a process is running!
- Take appropriate measures to prevent the equipment from being accidentally actuated!

CAUTION!
Avoid maladjustment of the controller due to an incorrect supply pressure or applied operating medium pressure!
- Run X.TUNE whenever the supply pressure (= pneumatic auxiliary energy) is available during subsequent operation.
- Run the X.TUNE function preferably without operating medium pressure to exclude interference caused by flow forces.

The following functions are actuated automatically:
- Adjustment of the sensor signal to the (physical) stroke of the actuator used
- Determination of parameters for the PWM signals to control the solenoid valves integrated in the positioner
- Adjustment of the controller parameters for the position controller. Optimisation occurs according to the criteria of a shortest possible correction time with a simultaneous freedom from overshoot.

→ You start Autotune by selecting X.TUNE in the main menu (MAIN) using the arrow keys.
→ Then hold down the right selection key (RUN) for approx. 3 seconds (countdown on display).

When the automatic adjustment completes, the message “X.TUNE READY” * is indicated.

→ Press any key to return to the main menu.

To stop X.TUNE, press the left or right selection key (STOP).

Sequence for automatic adjustment of the position controller to the particular operating conditions

<table>

2.4.5 Adding auxiliary functions

ADD.FUNCTION

With ADD.FUNCTION auxiliary functions can be included in the main menu. See chapter entitled "Configuration of auxiliary functions".

→ Skip this menu option during the initial start-up.

2.4.6 Leaving the main menu

To leave the main menu, press the left selection key (EXIT).

In doing so, the changes are transferred to the memory (EEPROM). "save EEPROM" is indicated on the display.

The device is then returned to the operating state in which it was before you switched to the main menu (MANUAL or AUTOMATIC).
3 OPERATION OF THE POSITION CONTROLLERS

A precise description of the control and display elements, as well as the configuration of the keys can be found in the chapter entitled "Control and display elements".

When the operating voltage has been switched on, the positioner is at the process operating level in the AUTOMATIC operating state.

At the process operating level the normal control mode is implemented and monitored (AUTOMATIC) and the valve is manually opened or closed (MANUAL).

3.1 Switching between the Operating States

The right Selection key can be used to switch between the two operating states AUTOMATIC (AUTO) and MANUAL (MANU). In the AUTOMATIC operating state a bar runs along the upper edge of the display from left to right.

3.2 Switching between the Operating Levels

Process operating level -> Configuration level

Both in the MANUAL and AUTOMATIC operating state you switch to the configuration level by pressing the left selection key (MENU) for approx. 3 seconds. During these 3 seconds 2 bars converge on the display (Countdown).

At the Configuration level the operating parameters can be input or changed, auxiliary functions supplemented or the automatic adjustment (X.TUNE) of the controller started.

A precise description of the individual functions can be found in the chapters entitled "Specifying the basic settings" and in "Configuring the auxiliary functions".

Configuration level -> Process operating level

Press the left selection key (EXIT) to switch from the Configuration level to the Process operating level. In doing so, the operating state which was selected before the switchover (AUTOMATIC or MANUAL) is set.
3.3 AUTOMATIC operating state

Bar running from left to right along the upper edge of the display.
Normal control mode is implemented and monitored in AUTOMATIC operating state.

3.3.1 Meaning of the keys

<table>
<thead>
<tr>
<th>key</th>
<th>Configuration</th>
<th>Description</th>

SFA: Actuator closes by spring force
SFB: Actuator opens by spring force
SFI: Actuator double-acting

3.4.2 Information on the Display

After switching to the MANUAL operating state, the display automatically jumps to the actual position (POS) of the valve actuator.

3.4.3 Operating structure

![Operating structure MANUAL](image)

*only if "Fall" is set in the DIR.ACT auxiliary function
4 CONFIGURING THE AUXILIARY FUNCTIONS

The operating concept for the positioner is based on a strict division between basic and auxiliary functions. When the device is delivered, only the basic functions are activated. They are used during the initial start-up to implement basic settings specific to the device. They are adequate for normal operation. For more demanding control tasks select and specify auxiliary functions at the Configuration level.

4.1 Keys at the Configuration level

</tr>
</tbody>
</table>
4.2 Configuration menu

4.2.1 Switching between Process operating level and Configuration level

To activate the Configuration menu, press the left selection key (MENU) at the Process operating level for approx. 3 seconds (wait for countdown).

The Configuration menu consists of the main menu and auxiliary menu. The main menu includes firstly the basic functions which you specify during the initial start-up. The auxiliary menu includes additional functions and is accessible via the ADD.FUNCTION menu option of the main menu. Device functions and parameters can be specified within the main menu. If required, extend the main menu with auxiliary menu functions which you can then specify.

4.2.2 Including auxiliary functions in the main menu

Press the arrow keys to select the ADD.FUNCTION menu option in the main menu and press the right selection key (ENTER) to enter the submenu.

Press the arrow keys to select the required auxiliary function.

Press the selection key on the right (ENTER) to mark the auxiliary function with a cross (x).

All marked functions are transferred to the main menu when the selection key on the left (EXIT) is pressed.

In the main menu input the parameters of the auxiliary functions.

4.2.3 Removing auxiliary functions from the main menu

If a function is removed from the main menu, the settings implemented previously under this function become invalid again.

Press the arrow keys to select the ADD.FUNCTION menu option in the main menu.

Enter the submenu by pressing the selection key on the right (ENTER).

Using the arrow keys, select an auxiliary function indicated with a cross (x).

Press the selection key on the right (ENTER) to remove the cross (x).

After pressing the selection key on the left (EXIT), the auxiliary function is deactivated and removed from the main menu.

4.2.4 Setting numerical values

You set numerical values in the designated menu options by pressing the up arrow key (increase numerical value) or down arrow key (reduce numerical value) once or several times.

In the case of four-digit numbers only the saved digit can be set with the up arrow key. Press the down arrow key to switch to the next digit (see Fig. 8).
4.2.5 Principle of including auxiliary functions in the main menu

**Main menu**

- ACTUATOR
- INPUT
- X.TUNE
- ADD.FUNCTION

**Auxiliary functions**

- ADD.FUNKTION
  - CHARACT
  - CUTOFF
  - DIR.CMD
  - DIR.ACT
  - SPLTRNG
  - X.LIMIT
  - X.TIME
  - X.CONTROL
  - SECURITY
  - SAFEPOS
  - SIG.ERROR
  - BINARY.IN
  - OUTPUT
  - CAL.USER
  - SET.FACTORY
  - SER. I/O
  - EXTRAS
  - SERVICE

**Extended main menu**

- ACTUATOR
- INPUT
- X.TUNE
- ADD.FUNCTION
- CHARACT
- X.CONTROL

**Fig. 8: Setting numerical values**

**Fig. 9: Including auxiliary functions**
4.3 Auxiliary functions

Overview of auxiliary functions for the position controller Type 8692

- **ADD.FUNCTION**: Selection of the transfer characteristic between input signal and stroke (correction characteristic)
- **CHARACT**: Sealing function for position controller
- **CUTOFF**: Effective sense of direction between input signal and nominal position
- **DIR.CMD**: Assignment of the aeration state of the actuator chamber to the actual position
- **DIR.ACT**: Signal split range; input signal as % for which the valve runs through the entire stroke range.
- **SPLTRNG**: Limit of the mechanical stroke range
- **X.LIMIT**: Limiting the control speed
- **X.CONTROL**: Parameters for the position controller
- **SECURITY**: Code protection for settings
- **SAFEPOS**: Inputting the safety position
- **SIG.ERROR**: Configuration of signal level fault detection
- **BINARY. IN**: Activating the binary input
- **OUTPUT**: Configuration of the outputs (only with auxiliary board for analogue feedback signal or binary outputs)
- **CAL.USER**: Calibration
- **SET.FACTORY**: Reset to factory settings
- **SER. I / O**: Configuration of serial interface
- **EXTRAS**: Set colours on display
- **SERVICE**: For internal use only

Fig. 10: Overview - auxiliary functions
4.3.1 CHARACT

Select the transfer characteristic between input signal (position set-point value) and stroke

Characteristic (customer-specific characteristic)

Use this auxiliary function to select a transfer characteristic with reference to set-point value (nominal position, CMD) and valve stroke (POS) for correction of the flow or operating characteristic.

Factory setting: linear

---

The flow characteristic \( k_v = f(s) \) indicates the flow of a valve, expressed by the \( k_v \) value depending on the stroke \( s \) of the actuator spindle. It is specified by the design of the valve seat and the seat seal. In general two types of flow characteristics are implemented, the linear and the equal percentage.

In the case of linear characteristics identical \( k_v \) value changes \( k_v \) are assigned to identical stroke changes \( ds \).

\[
(\Delta k_v = n_{lin} \cdot \Delta s).
\]

In the case of an equal percentage characteristic an equal percentage change of the \( k_v \) value corresponds to a stroke change \( ds \).

\[
(\frac{\Delta k_v}{k_v} = n_{equalper} \cdot \Delta s).
\]

The operating characteristic \( Q = f(s) \) specifies the correlation between the volumetric flow \( Q \) in the installed valve and the stroke \( s \). This characteristic has the properties of the pipelines, pumps and consumers. It therefore exhibits a form which differs from the flow characteristic.

* Input the nodes see "Inputting the freely programmable characteristic"
In the case of control tasks for closed-loop control systems it is usually particular demands which are placed on the course of the operating characteristic, e.g. linearity. For this reason it is occasionally necessary to correct the course of the operating characteristic in a suitable way. For this purpose the positioner features a transfer element which implements different characteristics. These are used to correct the operating characteristic.

Equal percentage characteristics 1:25, 1:33, 1:50, 25:1, 33:1 and 50:1 and a linear characteristic can be set. Furthermore, a characteristic can be freely programmed via nodes or automatically calibrated.

Inputting the freely programmable characteristic

The characteristic is defined via 21 nodes which are distributed uniformly via the position set-point values ranging from 0 – 100 %. Their distance is 5 %. A freely selectable stroke (adjustment range 0 – 100 %) is assigned to each node. The difference between the stroke values of two adjacent nodes must not be larger than 20 %.

* If the sub-menu is left by pressing the selection key on the left (ESC), the value remains unchanged.
Procedure:

→ To input the characteristic points (function values), select the FREE sub-menu option using the arrow keys and confirm by pressing the selection key on the right (SELEC).

Another sub-menu (FREE) opens in which the individual nodes are listed (as %).

→ Select the individual nodes using the arrow keys and confirm by pressing the selection key on the right (INPUT) in order to change the value in the SET VALUE sub-menu.

![Diagram of SET VALUE sub-menu]

Previously set value (as %)

This value (as %) is changed with the arrow keys

Return without change

Accept the set value

→ Using the arrow keys (+/-), set the function value from 0 to 100 % and confirm by pressing the selection key on the right (OK).

→ When all changes have been made, leave the sub-menu by pressing the selection key on the left (EXIT).

→ Press the selection key on the left again (EXIT) to return to the CHARACT menu option.

Changed values are not transferred into the memory (EEPROM) until the main menu (MAIN) is left.
Example of a programmed characteristic

![Graph](image_url)

Fig. 14: Example of a programmed characteristic

In the Appendix “Table of position controllers” there is a table in which you can enter your settings for the freely programmable characteristic.
4.3.2 CUTOFF
Sealing function for the position controller Type 8692

The sealing function for the process controller Type 8693 can be found in the chapter entitled “Start-up, operation of the process controller Type 8693” - “Auxiliary functions for the process controller”.

This function causes the valve to be sealed outside the control area.
This is where you input the limits for the position set-point value (CMD) as a percentage, from which the actuator is fully de-aerated or aerated.
Control mode opens or resumes at a hysteresis of 1 %.
If the process valve is in the sealing area, the message "CUTOFF ACTIVE" is indicated on the display.

Factory setting: Min = 0 %; Max = 100 %

![Diagram of CUTOFF function]

Fig. 15: Operating structure CUTOFF

!! Changed values are not transferred into the memory (EEPROM) until the main menu (MAIN) is left.

![Graph of CUTOFF function]

Fig. 16: Graph - CUTOFF

* If the sub-menu is left by pressing the selection key on the left (ESC), the value remains unchanged.
4.3.3 **DIR.CMD**

Effective sense of direction of the position controller set-point value

Use this auxiliary function to set the effective sense of direction between the input signal (INPUT) and the nominal position (CMD) of the actuator.

Factory setting: *Rise*

---

**Fig. 17: Operating structure DIR.CMD**

- **Direct effective direction**
  - (e.g. 4 mA or 0 V → 0 %, 20 mA or 5/10 V → 100%)

- **Inverse effective direction**
  - (e.g. 4 mA or 0 V → 100%, 20 mA or 5/10 V → 0%)

---

**Changed values are not transferred into the memory (EEPROM) until the main menu (MAIN) is left.**

---

**Fig. 18: Graph DIR.CMD**

- **Nominal position (CMD)**
- **Input signal (INPUT)**

- **RISE**
- **FALL**

- **0/4 mA, 0 V**
- **20 mA, 5/10 V**
4.3.4 **DIR.ACT**

**Effective sense of direction of the actuator**

Use this auxiliary function to set the effective sense of direction between the aeration state of the actuator and the actual position (POS).

**Factory setting:** *Rise*

![Operating structure DIR.ACT](image)

<table>
<thead>
<tr>
<th>DIR.ACT</th>
<th>ENTER</th>
<th>Rise</th>
<th>SELEC</th>
<th>EXIT</th>
<th>Fall</th>
</tr>
</thead>
</table>

Direct effective direction (deaerated → 0 %; aerated 100 %)

Inverse effective direction (deaerated → 100 %; aerated 0 %)

![Graph DIR.ACT](image)

*Fig. 19: Operating structure DIR.ACT*

If the *Fall* function is selected, the description of the arrow keys (on the display) changes in the MANUAL operating state (OPN → CLS and CLS → OPN).

Changed values are not transferred into the memory (EEPROM) until the main menu (MAIN) is left.
4.3.5 **SPLTRNG**

**Signal split range**

Min. and max. values of the input signal as % for which the valve runs through the entire stroke range.

Factory setting: \( \text{Min} = 0 \%; \quad \text{Max} = 100 \% \)

This function is effective only during operation as a position controller.

Use this auxiliary function to limit the position set-point value range of the positioner by specifying a minimum and a maximum value. As a result, it is possible to divide a utilised unit signal range (4 – 20 mA, 0 – 20 mA, 0 – 10 V or 0 – 5 V) into several positioners (without or with overlapping). This allows several valves to be used alternatively or in the case of overlapping set-point value ranges simultaneously as actuators.

**Fig. 21: Operating structure SPLTRNG**

<table>
<thead>
<tr>
<th>Min</th>
<th>0 %</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max</td>
<td>100 %</td>
</tr>
</tbody>
</table>

Input the minimum value of the input signal as %
Adjustment range: 0 ... 75 %

Input the maximum value of the input signal as %
Adjustment range: 25 ... 100 %

Changed values are not transferred into the memory (EEPROM) until the main menu (MAIN) is left.

**Splitting a unit signal range into two set-point value ranges**

*If the sub-menu is left by pressing the selection key on the left (ESC), the value remains unchanged.*
4.3.6 X.LIMIT
Limits the mechanical stroke range

This auxiliary function limits the (physical) stroke to specified % values (minimum and maximum). In doing so, the stroke range of the limited stroke is set equal to 100 %. If the limited stroke range is left during operation, negative POS values or POS values are indicated greater than 100 %.

Factory setting: \( Min = 0 \%, \quad Max = 100 \% \)

---

**Fig. 23: Operating structure X.LIMIT**

- Changed values are not transferred into the memory (EEPROM) until the main menu (MAIN) is left.

---

**Fig. 24: Graph X.LIMIT**

* If the sub-menu is left by pressing the selection key on the left (ESC), the value remains unchanged.
4.3.7 X.TIME
Limiting the control speed

Use this auxiliary function to specify the opening and closing times for the entire stroke and limit the control speeds.

⚠️ When the X.TUNE function is running, the minimum opening and closing time for the entire stroke is automatically entered for Open and Close. Therefore, movement can be at maximum speed.

Factory setting: values determined at the factory by the X.TUNE

If the control speed is limited, values can be input for Open and Close which are between the minimum values determined by the X.TUNE and 60 s.

![Operating structure X.TIME diagram]

Fig. 25: Operating structure X.TIME

⚠️ Changed values are not transferred into the memory (EEPROM) until the main menu (MAIN) is left.

Effect of limiting the opening speed when there is a jump in the set-point value

![Graph X.TIME]

Fig. 26: Graph X.TIME

* If the sub-menu is left by pressing the selection key on the left (ESC), the value remains unchanged.
4.3.8 X.CONTROL
Parameterisation of the position controller

Use this function to set the parameters for the position controller (dead band and amplification factors).

**Fig. 27: Operating structure X.CONTROL**

**DBND**  
Insenitivity range (dead band) of the position controller  
Input the dead band as %, relating to the scaled stroke range;  
i.e. $X.LIMIT_{Max} - X.LIMIT_{Min}$ (see Auxiliary function X.LIMIT).  
This function causes the controller to respond from a specific control difference only. This function protects the solenoid valves in the positioner and the pneumatic actuator.

If the auxiliary function X.CONTROL is in the main menu while X.TUNE (Autotune of the position controller) is running, the dead band DBND is determined automatically depending on the friction behaviour of the actuator. The value determined in this way is an approximate value. You can re-adjust it manually.

**Fig. 28: Graph X.CONTROL**

**KX XXX**  
Parameters for the position controller

- **KXopn**: Amplification factor of the position controller (for closing the valve)
- **KXcls**: Amplification factor of the position controller (for opening the valve)
4.3.9  SECURITY
Code protection for the settings

Use the SECURITY function to prevent the positioner or individual functions from being accessed unintentionally.

Factory setting: Access Code:  0000

If the code protection is activated, the code (set access code or master code) must be input whenever operator action is disabled.

All operator actions can be implemented with the non-changeable master code. This 4-digit master code can be found in the appendix of these operating instructions in the chapter entitled "Master code".

Input screen for inputting or changing the access code (for description of input see below)

Blocking access to the configuration level

Blocking switchover between the MANUAL / AUTOMATIC (MANU/AUTO) operating states

Blocking the input of auxiliary functions

Blocking the activation of self-parameterisation (Autotune)

Inputting the access code:

→ Press the selection key on the right (INPUT) to access the input screen when the CODE selection menu is marked.

The code consists of four digits which can be changed individually by pressing the up arrow key (+).

Press the down arrow key (←) to jump between the individual digits.

Press the selection key on the left (ESC) to leave the input screen without change.

Press the selection key on the right (OK) to leave the input screen and save the input or change.
4.3.10 SAFEPOS  
Input the safety position

This function specifies the actuator safety position which is started at defined signals.

The set safety position is not started unless there is a corresponding signal at the binary input (for configuration see BINARY-IN) or if a signal error occurs (for configuration see SIG-ERROR).

In the case of the bus version (Profibus / DeviceNet) the safety position is also started with
• corresponding parameter telegram
• BUS ERROR (adjustable)

If the mechanical stroke range is limited with the XLIMIT function, only safety positions within these limits can be started.

This function is executed in AUTOMATIC mode only.

Factory setting: 0 %

---

Fig. 30: Operating structure SAFEPOS

Changed values are not transferred into the memory (EEPROM) until the main menu (MAIN) is left.

---

* If the sub-menu is left by pressing the selection key on the left (ESC), the value remains unchanged.

** If the safety position is 0 % or 100 %, the actuator is completely deaerated or aerated as soon as the safety position SIG-ERROR or BINARY-IN is active in the auxiliary functions.
4.3.11 **SIG-ERROR**

Configuration of signal level fault detection

The SIG-ERROR function is used to detect a fault on the input signal.

**Fault detection**

Fault detection can be selected at 4 – 20 mA signal only:

Fault with input signal ≤ 3.5 mA (± 0.5 % of final value, hysteresis 0.5 % of final value)

If other signal types are selected, the respective menu branch is hidden. If this configuration does not allow fault detection, *not available* is indicated in the selection menu.

![Operating structure SIG-ERROR](image)

If signal fault detection is activated, the respective fault is indicated on the display.

(see chapter entitled "Maintenance and troubleshooting")

**Safety position SAFEPOS on**

When SAFEPOS on is set, the following configurations may occur:

Active SAFEPOS menu option

If a fault is detected, the actuator moves to the lower SAFEPOS set position.

Inactive menu option SAFEPOS

If a fault is detected, the actuator moves to the end position which it would specify in the isolated state.
4.3.12 **BINARY-IN**
Activation of the binary input

This function activates the binary input.

The following settings can be implemented for this:

- Approaching the safety position
- Switching over the MANUAL/AUTOMATIC operating mode

**Fig. 32: Operating structure BINARY-IN**

**Safety position SAFEPOS**
Approach of a safety position.
Active SAFEPOS menu option
The actuator moves to the lower SAFEPOS set position.
Inactive SAFEPOS menu option
The actuator moves to the end position which it would specify in the isolated state.

**Operating mode switchover MANU/AUTO**
Switch over the operating state to MANUAL or AUTOMATIC.
Binary input = 0 → AUTOMATIC operating mode
Binary input = 1 → MANUAL operating mode
If operating mode switchover is selected, you can no longer switch over the operating mode via the selection key on the right (MANU/AUTO).
4.3.13 **OUTPUT** (option)

Configuring the outputs

The **OUTPUT** menu option is only indicated in the selection menu of **ADD.FUNCTION** if the positioner has outputs (option).

**The outputs can be used for the following feedback signals:**

**Analogue output:** Feedback signal of the current position (**POS**) or of the set-point value (**CMD**) to the control centre.

**Binary outputs:** Alarm output for excessively large control deviations of the position controller or
for the output of the current position with respect to a specified limit position (>) or <)
or for the output: actuator in safety position or
for the output: sensor break or
for the output: operating state (AUTOMATIC / MANUAL).

**The positioner which has the outputs option is available in the following versions:**

- one analogue output
- one analogue and two binary outputs
- two binary outputs

According to the version of the positioner only the possible adjustable outputs (**ANALOGUE, ANALOGUE + BIN 1 + BIN 2** or **BIN 1 + BIN 2**) are indicated in the **OUTPUT** menu option.

---

**Fig. 33: Operating structure OUTPUT**

1. Configuration of the analogue output
2. Configuration of the binary output 1
3. Configuration of the binary output 2
**OUT ANALOG - Configuration of the analogue output**

Only for the versions:
- one analogue output
- one analogue and two binary outputs

The feedback signal of the current position (POS) or of the set-point value (CMD) can be transmitted to the control centre via the analogue output.

![Diagram of OUT ANALOG configuration](image)

**Fig. 34: Operating structure OUTPUT-ANALOGUE**

Changed values are not transferred into the memory (EEPROM) until the main menu (MAIN) is left.
2. **OUT BIN1** - Configuration of the binary output 1

3. **OUT BIN2** - Configuration of the binary output 2

The following description is valid for both binary outputs **OUT BIN 1** and **OUT BIN 2**, as the operation in the menu is identical.

The binary outputs 1 and 2 can be used for one of the following outputs:

- Alarm output for excessively large control deviations of the position controller
- for the output of the current position with respect to a specified limit position (> or <)
- for the output: actuator in safety position
- for the output: sensor break
- for the output: operating state (AUTOMATIC / MANUAL)

![Diagram of binary output configuration](image)

**Fig. 35: Operating structure OUTPUT-BIN1**

- **Normally closed** output, in switched state low (≈ 0 V)
- **Normally opened** output, in switched state high (≈ 24 V)

- Changed values are not transferred into the memory (EEPROM) until the main menu (MAIN) is left.

* If the sub-menu is left by pressing the selection key on the left (ESC), the value remains unchanged.

** The permitted control deviation Lim DEV.X XX must not be less than the dead band.
Alarm output for excessively large control deviation of the position controller: **OUT DEV.X**

→ Press the arrow keys to mark the **OUT DEV.X** menu option and confirm with the selection key on the right (SELEC).

→ Press the arrow keys to input the limit value for the permitted control deviation in the **Lim. DEV.X** menu option and accept with the selection key on the right (OK).

The permitted control deviation **Lim. DEV.X XX** must not be less than the dead band.

→ In the **OUT BIN type** menu option input the required switching status (normally opened / normally closed)*.

### Output of the current position with respect to a specified limit position: **OUT POS**

→ Press the arrow keys to mark the **OUT POS** menu option and confirm with the selection key on the right (SELEC).

→ Press the arrow keys to input the the value of the limit position in the **Lim. POS 0%** menu option and accept with the selection key on the right (OK).

→ In the **OUT BIN type** menu option input the required switching status (normally opened / normally closed).

### Output of message: Actuator in safety position: **OUT Safepos**

→ Press the arrow keys to mark the **OUT Safepos** menu option and confirm with the selection key on the right (SELEC).

→ In the **OUT BIN type** menu option input the required switching status (normally opened / normally closed)*.

### Output sensor break: **OUT ERR SP/CMD**

→ Using the arrow keys, mark the **OUT ERR SP/CMD** menu option and confirm with the selection key on the right (SELEC).

→ In the **OUT BIN type** menu option input the required switching status (normally opened / normally closed)*.

### Output operating state AUTOMATIC / MANUAL: **OUT remote**

→ Using the arrow keys, mark the **OUT remote** menu option and confirm with the selection key on the right (SELEC).

→ In the **OUT BIN type** menu option input the required switching status (normally opened / normally closed).

* Normally closed output, in switched state low (≈ 0 V)

Normally opened output, in switched state high (≈ 24 V)
4.3.14 CAL.USER

Calibrating the actual value display and the inputs for the position set-point value

The following points can be manually calibrated with this function:

- Position display (POS) 0 – 100%
- Position set-point value display (INPUT)

---

Remove the CAL.USER auxiliary function to re-activate the factory calibration.

---

* If the sub-menu is left by pressing the selection key on the left (ESC), the value remains unchanged.

** The signal type is displayed which is selected in the INPUT menu (4 – 20 mA; 0 – 20 mA; 0 – 5 V; 0 – 10 V).
Procedure:

Calibrating the actual value display \textit{POS} (0 - 100 \%): \textit{calibr. POS}

\begin{itemize}
  \item In the \textit{CAL. USER} menu press the arrow keys to select the \textit{calibr. POS} menu option and confirm with the selection key on the right (ENTER).
  \item Accept the minimum position:
    \begin{itemize}
      \item Press the arrow keys to select the \textit{POS lower X} menu option and confirm with the selection key on the right (INPUT).
      \item Approach the minimum position of the valve using the arrow keys (OPN/CLS) and confirm this value by pressing the selection key on the right (OK).
    \end{itemize}
  \item Accept the maximum position:
    \begin{itemize}
      \item Press the arrow keys to select the \textit{POS upper X} menu option and confirm with the selection key on the right (INPUT).
      \item Approach the maximum position of the valve using the arrow keys (OPN/CLS) and confirm this value by pressing the selection key on the right (OK).
    \end{itemize}
\end{itemize}

Calibrating the position set-point value (4 – 20 mA; 0 – 20 mA; 0 – 5 V; 0 – 10 V): \textit{calibr. INP}

\begin{itemize}
  \item In the \textit{CAL. USER} menu press the arrow keys to select the \textit{calibr. INP} menu option and confirm with the selection key on the right (ENTER).
  \item Accept the minimum input signal (0 mA; 4 mA; 0 V):
    \begin{itemize}
      \item Using the arrow keys, select the \textit{INP (0 mA; 4 mA; 0 V)} menu option and confirm with the selection key on the right (INPUT).
      \item Apply the minimum value of the unit signal on the input and confirm by pressing the selection key on the right (OK).
    \end{itemize}
  \item Accept the maximum input signal (20 mA; 5 V; 10 V):
    \begin{itemize}
      \item Using the arrow keys, select the \textit{INP (20 mA; 5 V; 10 V)} menu option and confirm with the selection key on the right (INPUT).
      \item Apply the maximum value of the unit signal on the input and confirm by pressing the selection key on the right (OK).
    \end{itemize}
\end{itemize}

Resetting the settings under \textit{CAL. USER} to the factory settings: \textit{copy FACT \rightarrow USER}

\begin{itemize}
  \item In the \textit{CAL. USER} menu select the \textit{copy FACT \rightarrow USER} menu option using the arrow keys and confirm with the selection key on the right (ENTER).
  \item Hold down the selection key on the right (RUN) (for approx. 3 seconds) until the countdown has elapsed.
\end{itemize}

\subsection*{4.3.15 SET.FACTORY}

\textbf{Resetting to the factory settings}

This function allows all settings implemented by the user to be reset to the delivery status.

All EEPROM parameters with the exception of the calibration values are reset to default values. Then a hardware reset is implemented.

![Fig. 37: Operating structure SET.FACTORY](image)

To activate the \textit{SET.FACTORY} function, hold down the selection key on the right (RUN) for approx. 3 s until the countdown has elapsed.

To adjust the positioner to the operating parameters, re-implement self-parameterisation of the position controller (\textit{X.TUNE}).
4.3.16 SER. I/O
Settings of the serial interface

This function can be used to set the type of the serial interface and the baud rate.

Fig. 38: Operating structure SER. I/O
4.3.17 **EXTRAS**

This function can be used to set the representation on the display.

![Operating structure EXTRAS](image)

4.3.18 **SERVICE**

This function is of no importance to the operator of the positioner. It is for internal use only.
Type 8692, 8693
Start-up, operation
position controller Type 8692
Start-up and operation of the position controller Type 8693

1 SAFETY INSTRUCTIONS

**DANGER!**

Danger – high pressure in the equipment!
There is a serious risk of injury when reaching into the equipment.
- Before loosening the lines and valves, turn off the pressure and vent the lines.

**WARNING!**

Danger - improper installation!
Improper installation may result in injuries as well as damage to the device and the area around it.
- Fluid and electrical installations may be carried out by authorised technicians only and with the appropriate tools!

Danger due to unintentional activation of the equipment!
Unintentional activation of the equipment during installation may result in injuries and damage.
- Take appropriate measures to prevent the equipment from being unintentionally activated.

2 STARTING UP AND SETTING UP THE PROCESS CONTROLLER
TYPE 8693

→ Before starting up the device, carry out the fluid and electrical installations as described in the chapter entitled “Installation”.

To set up the positioner as a process controller, it is first necessary to specify the basic functions of the position controller and then supplement the auxiliary functions for the process control.

2.1 Description of the procedure

When the operating voltage has been switched on, the positioner is at the process operating level in the AUTOMATIC operating state.

To specify the basic settings, you must switch to the configuration level:
→ Hold down the left selection key (MENU) for approx. 3 seconds (wait for countdown on display).

Then the main menu is indicated on the display (MAIN).
→ Press the arrow keys to switch between the main menu options and select a menu option with the right selection key (ENTER/RUN).

Depending on the function, a menu sub-option or a selection screen is indicated on the display.
→ Press the arrow keys to switch between these sub-options and select the required settings. Press the right selection key (SELECT/ENTER) to confirm the selection (the point after the selected parameter is now marked). Return to the main menu by pressing the left selection key (EXIT).
→ To save the changed settings, you must leave the configuration level by pressing the left selection key (EXIT).

You are back at the process operating level.

Only when you leave the configuration level by pressing the right selection key, are the changed parameters and settings saved (“save EEPROM”).
2.2 Factory settings of the process controller

</table>

The factory settings of the position controller can be found in the chapter entitled "Start-up and operation of the position controller Type 8692" - "Factory settings of the position controller".

2.3 Procedure for setting up a process control

**CAUTION!**

The process control cannot be implemented until the position controller has been automatically adjusted (X.TUNE)!

- Always observe the following sequence: X.TUNE → P.Q’LIN

To operate the positioner as a process controller, implement the following steps:

**Setting up the position controller:**

A → Specify the standard settings of the positioner and automatically adjust the position controller (X.TUNE).

**Setting up the process controller:**

B → Start the P.CONTROL auxiliary function via the configuration menu in the main menu.

The P.CONTROL function also inserts the P.Q’LIN function into the main menu.

C → Implement the standard settings for the process controller under P.CONTROL.

D Linearisation of the process characteristic

If this is a flow control process, the process characteristic can be linearised automatically:

→ Implement the P.Q’LIN function.
2.4 Setting up the position controller

Specification of the basic settings is described in the chapter entitled "Start-up and operation of the position controller Type 8692" - "Specifying the basic settings".

When starting up the positioner for the first time, implement the following basic settings:

- Specify the selected unit signal input for the set-point value default (INPUT) (4 – 20 mA, 0 – 20 mA, 0 – 10 V or 0 – 5 V).
- Start automatic adjustment of the position controller to the particular operating conditions (X.TUNE).

The exact description of the functions INPUT and X.TUNE can be found in the chapter entitled "Start-up and operation of the position controller Type 8692" - "Description of the functions of the main menu".

The basic settings for the positioner are implemented at the factory. During start-up, however, it is essential to input the unit signal (INPUT) and run X.TUNE. Using the X.TUNE function, the positioner automatically determines the optimum settings for the current operating conditions.

2.5 Setting up the process controller

2.5.1 Starting the P.CONTROL auxiliary function

How to start the auxiliary functions is described in the chapter entitled "Start-up and operation of the position controller Type 8692" - "Configuring the auxiliary functions".

- Press the left selection key (MENU) to switch to the configuration level in the main menu (MAIN).
- Press the arrow keys to select the ADD.FUNCTION menu option and confirm by pressing the right selection key (ENTER).
- Press the left selection key (EXIT) to return to the main menu.

The main menu now contains the P.CONTROL and PQ’LIN auxiliary functions.
2.5.2 Basic settings for the P.CONTROL function

Fig. 1: Operating structure P.CONTROL

1. Insensitivity area (dead band) of the PID process controller
2. Amplification factor of the process controller
3. Reset time
4. Hold-back time
5. Working point
6. Filtering of the process actual value input
7. Indication of the signal type for process actual value
8. Scaling the process controller
9. Type of the set-point value default (internal or external)
10. Scaling the position controller (for external set-point value default only)
11. Enables a smooth switchover between AUTOMATIC and MANUAL mode

* The SP SCALE function is indicated only if the external set-point value default (external) menu option is activated under SP INPUT.
2.5.3 Parameter setting of the process controller - PARAMETER

These positioner functions are used to specify the control parameters of the process controller.

The basic principles of setting a controller can be found in the chapter entitled "General rules" - "Properties of PID controllers".

① DBND - Insensitivity area (dead band) of the process controller

This function causes the process controller to respond from a specific control difference only. This protects both the solenoid valves in the positioner and the pneumatic actuator.

Factory setting: 1.0 % (with reference to the range of the process actual value scaled by PV SCALE - PVmin and PVmax)

* If the sub-menu is left by pressing the selection key on the left (ESC), the value remains unchanged.
2. **KP - Amplification factor of the process controller**

The amplification factor specifies the P-contribution of the PID controller.

Factory setting: 1.00

![Diagram of KP adjustment](image)

Adjustment range: 0 – 99.99 (% / set unit)

*The KP amplification of the process controller refers to the scaled unit.*

3. **TN - Reset time of the process controller**

Specifies the I-contribution of the PID controller.

Factory setting: 999.9 s

![Diagram of TN adjustment](image)

Adjustment range: 0.5 – 999.9 s

4. **TV - Hold-back time of the process controller**

Specifies the D-contribution of the PID controller.

Factory setting: 0.0 s

![Diagram of TV adjustment](image)

Adjustment range: 0 – 999.9 s

*If the sub-menu is left by pressing the selection key on the left (ESC), the value remains unchanged.*
5. **X0 - Working point of the process controller**

Operating point in rest state.

Factory setting: 0.0 %

![Fig. 7: Operating structure P.CONTROL - X0](image)

The "Process controller tables" appendix contains a table "Set parameters of the process controller" in which you can enter your parameters.

6. **FILTER - Filtering of the process actual value input**

The filter is valid for all process actual value types and has a low pass behaviour (PT1).

Factory setting: 0

![Fig. 8: Operating structure P.CONTROL - FILTER](image)

**Setting in 10 stages**

<table>

2.5.4 Setting up the process controller - **SETUP**

These functions specify the type of control.

### PV INPUT - Indication of the signal type for the process actual value

The PV INPUT function specifies the signal type of the process actual value:

- **Unit signal**  
  - 4 ... 20 mA  
  - Flow, pressure, level

- **Frequency signal**  
  - 0 ... 1,000 Hz  
  - Flow

- **Circuit with PT 100**  
  - -20 °C – +220 °C  
  - Temperature

Factory setting: 4 ... 20 mA

![Fig. 9: Operating structure P.CONTROL - PV-INPUT](image)

### PV-SCALE - Scaling of the process controller

The PV-SCALE function specifies the following settings:

- The unit of the process actual value.
- The position of the decimal point.
- The values for the lower and upper process actual value.

If the settings for the unit of the process actual value or the position of the decimal point are input or changed, this setting applies to all scaling values (SPmin, SPmax, PVmin, PVmax).

**Procedure for setting the scaling values**

**Inputting the unit and the position of the decimal point for the scaling values (possible in PVmin only):**

1. Press the arrow keys to select the PV SCALE menu option and confirm by pressing the right selection key (ENTER).
2. Press the right selection key (INPUT) to enter the input screen for PVmin.
3. On the display the field for the unit has a dark background and is therefore marked.
4. Press the up arrow key (+) to select the unit (bar, mbar, ... °F)* of the scaling values.
5. Press the down arrow key (←) to change the dark highlighted background to the decimal point of the value which specifies the position of the decimal point with the aid of the up arrow key (+).

**Inputting the scaling value:**

1. Press the down arrow key (←) to change the dark highlighted background to the last digit of the value.
2. Press the up arrow key (+) to specify the individual digits of the value and switch to the next digit with the down arrow key (←).
3. When all input values have been specified, confirm by pressing the right selection key (OK) and jump back to the selection screen.

*The units indicated here depend on the signal type (PV INPUT).
PV-SCALE - 1 - Scaling of the process controller for signal type 4 – 20 mA (PV-INPUT 4 – 20 mA)

With the PV-SCALE function for signal type 4 – 20 mA the following settings are specified:

- The unit of the process actual value.
- The position of the decimal point.
- The values for the lower and upper process actual value are assigned to the respective current value of the unit signal.

If the settings for the unit of the process actual value or the position of the decimal point are input or changed, this setting applies to all scaling values (PVmin, PVmax, SPmin, SPmax).

Fig. 10: Operating structure P.CONTROL - PV-SCALE - 4-20mA

Scaling example of the 4 – 20 mA input

- Process actual value from the transmitter: 4 ... 20 mA corresponds to 0 – 10 l/min
- Process set-point value from PLC: 4 ... 20 mA corresponds to 0 – 8 l/min

Example of inputting scaling values

<table>
<thead>
<tr>
<th></th>

</tr>
</tbody>
</table>

For SP INPUT internal (set-point value default via the arrow keys) the scaling of the set-point value via SPmin and SPmax is not possible. The set-point value can be input directly according to the scaled process variable (PVmin, PVmax).

* If the sub-menu is left by pressing the selection key on the left (ESC), the value remains unchanged.
** This setting specifies the reference range for the dead band of the process controller as well as for the analogue feedback of the process actual value (option).
The **PV-SCALE** function specifies the following settings for frequency input signal type:

- The unit of the process actual value.
- The position of the decimal point.
- The values for the lower and upper process actual value.
- The K-factor.

If the settings for the unit of the process actual value or the position of the decimal point are input or changed, this setting applies to all scaling values (PVmin, PVmax, SPmin, SPmax).

**Fig. 11: Operating structure P.CONTROL - PV-SCALE - Frequency**

1. **PVmin X/x**
   - **Lower scaling value for the process actual value**
   - **Settings:**
     1. **Select the unit for the flow**
        - The unit on the display has a dark background. Press the up arrow key (+) to select from the following units:
        - l/s, l/min, l/h, m³/min, m³/h, UG/s (gal(US)/s), UG/min (gal(US)/min), UG/h (gal(US)/h), IG/s (gal(Imperial)/s), IG/min (gal(Imperial)/min), IG/h (gal(Imperial)/h).
     2. **Input the position of the decimal point**
        - Press the down arrow key (←) to highlight the decimal point with a dark background. Press the up arrow key (+) to specify the position.
     3. **Input the lower scaling value for the process actual value**
        - Press the down arrow key (←) to highlight the individual positions with a dark background. Press the up arrow key (+) to set the value.
        - Adjustment range: 0 ... 9999
        - This setting specifies the reference range for the dead band of the process controller as well as for the analogue feedback of the process actual value (option).

* If the sub-menu is left by pressing the selection key on the left (ESC), the value remains unchanged.
**Type 8692, 8693**
Start-up, operation
process controller Type 8693

---

### Upper scaling value for the process actual value

Settings:
The unit for flow and the position for the decimal point is transferred from the inputs of the lower scaling value.

1. **Input the upper scaling value for the process actual value**

   Press the down arrow key (\( \rightarrow \)) to highlight the individual positions with a dark background.
   Press the up arrow key (\( + \)) to set the value.

   **Adjustment range:** 0 ... 9999

   This setting specifies the reference range for the dead band of the process controller as well as for the analogue feedback of the process actual value (option).

---

### Manually inputting the K-factor for the flow sensor

(e.g. from the data sheet of the flow sensor)

1. **Input the position of the decimal point**

   The decimal point on the display has a dark background. Press the up arrow key (\( + \)) to specify the position.

   **Adjustment range:** 1 or 2

2. **Input the K-factor**

   Press the down arrow key (\( \rightarrow \)) to highlight the individual positions with a dark background.
   Press the up arrow key (\( + \)) to set the value.

   **Adjustment range:** 0 ... 9999

---

### Teach-in function:

Calculating the K-factor by measuring a specific flow rate.

→ Hold down the selection key on the right (ENTER) for approx. 3 s (countdown on display)

**Warning:** When this menu is entered, the valve is closed in order to have a defined initial state for implementation of the Teach-in function.

**Starting the measurement**

→ Press the selection key on the right (START) to start the measurement (the message "Teach-in at work" is displayed briefly).

   The valve is opened and the container is filled ("fill .." is indicated on the display).

**Ending the measurement**

→ Press the selection key on the right (STOP) to complete the measurement and to display the input screen for the volume.

**Inputting the position of the decimal point**

The decimal point on the display has a dark background.

→ Press the up arrow key (\( + \)) to specify the position.

**Inputting the measured volume**

→ Press the down arrow key (\( \rightarrow \)) to highlight the individual positions with a dark background.
   Press the up arrow key (\( + \)) to set the value.

**Adjustment range:** 0 ... 9999
The PV-Scale function specifies the following settings for the Pt 100 signal type:

- The unit of the process actual value.
- Position of the decimal point.
- The values for the lower and upper process actual value.

If the settings for the unit of the process actual value or the position of the decimal point are input or changed, this setting applies to all scaling values (PVmin, PVmax, SPmin, SPmax).

---

**PVmin**

1. Select the unit for the temperature
   - The unit on the display has a dark background. Press the up arrow key (+) to select from the following units:
     - °C or °F.

2. Input the position of the decimal point
   - Press the down arrow key (←) to highlight the decimal point with a dark background. Press the up arrow key (+) to specify the position.
   - Adjustment range: 1 or 2

3. Input the lower scaling value for the process actual value
   - Press the down arrow key (←) to highlight the individual positions with a dark background. Press the up arrow key (+) to set the value.
   - Adjustment range: -200 ... 800

Measurement range of the Pt 100: -20 °C – 220 °C or -4 °F – 428°F

This setting specifies the reference range for the dead band of the process controller as well as for the analogue feedback of the process actual value (option).

*If the sub-menu is left by pressing the selection key on the left (ESC), the value remains unchanged.*
**Upper scaling value for the process actual value**

Settings:
The unit for the temperature and the position for the decimal point is transferred from the inputs of the lower scaling value.

1. **Input the upper scaling value for the process actual value**
   - Press the down arrow key (←) to highlight the individual positions with a dark background.
   - Press the up arrow key (+) to set the value.
   - Adjustment range: -200 ... 800
   - Measurement range of the PT 100: -20 °C – 220 °C or -4 °F – 428°F
   - This setting specifies the reference range for the dead band of the process controller as well as for the analogue feedback of the process actual value (option).

**SP INPUT - Type of set-point value default (internal / external)**

This function specifies whether the set-point value default
- internal: is implemented by pressing the keys on the positioner or
- external: is implemented via the unit signal input.

Factory setting: **internal**

![Diagram](image_url)

Fig. 13: Operating structure P.CONTROL - SP-INPUT
**SP - SCALE - Scaling of the position controller**

This function is indicated in the selection menu only if the external set-point value default (external) has been selected in the SP INPUT menu option.

The SP-SCALE function assigns the values for the lower and upper process set-point value to the particular current or voltage value of the unit signal.

**Procedure for setting the scaling values (in the example of the lower scaling value SPmin):**

1. Press the right selection key (INPUT) to enter the input screen for SPmin.
2. On the display the last digit of the value is highlighted with a dark background.
3. Press the up arrow key (+) to specify the individual digits of the value and switch to the next digit with the down arrow key (→).
4. When all input values have been specified, confirm by pressing the right selection key (OK) and jump back to the selection screen.

**P.CO INIT - Setting the smooth switchover between MANUAL and AUTOMATIC mode**

The PCO INIT function enables a smooth switchover between the MANUAL and AUTOMATIC operating states.

Factory setting: *bumpless*

*If the sub-menu is left by pressing the selection key on the left (ESC), the value remains unchanged.*
2.5.5 Linearisation of the process characteristic \( P.Q'LIN \)

This function automatically linears the process characteristic of a flow control.

\[ \text{This function is only meaningful if a flow control is to be implemented.} \]

The \( P.Q'LIN \) function can only be started if the menu option \( P.CONTROL / SETUP / PV-INPUT / frequency \) or \( P.CONTROL / SETUP / PV-INPUT / 4-20 \ mA \) has been selected.

When the \( P.CONTROL \) function is activated, the \( P.Q'LIN \) functions required for process control are copied into the main menu. This function starts the program which automatically determines the nodes for a correction characteristic.

→ Start the routine to linearise the process characteristic by selecting the \( P.Q'LIN \) menu option in the main menu and press the selection key on the right (RUN) for approx. 3 seconds (countdown).

The program increases the valve stroke in 20 steps from 0 to 100 % and measures the associated process variable. The value pairs of the correction characteristic are placed as a freely programmable characteristic under the \( CHARACT / FREE \) menu option and can be viewed under this menu option.

If the \( CHARACT \) menu option under the \( ADDFUNCTION \) menu option was not transferred into the main menu, the transfer occurs automatically when the \( P.Q'LIN \) function is implemented. At the same time the \( CHARACT / FREE \) menu option is activated.

**Displays on the panel during selection and implementation of the routine**

3 OPERATION OF THE PROCESS CONTROLLER

A precise description of the control and display elements, as well as the configuration of the keys can be found in the chapter entitled “Control and display elements”.

When the operating voltage has been switched on, the positioner is at the process operating level in the AUTOMATIC operating state. At the process operating level the normal control mode is implemented and monitored (AUTOMATIC) and the valve is manually opened or closed (MANUAL).

3.1 Switching between the Operating States

The right Selection key can be used to switch between the two operating states AUTOMATIC (AUTO) and MANUAL (MANU). In the AUTOMATIC operating state a bar runs along the upper edge of the display from left to right.

3.2 Switching between the Operating Levels

Process operating level -> Configuration level

Both in the MANUAL and AUTOMATIC operating state you switch to the configuration level by pressing the left selection key (MENU) for approx. 3 seconds. During these 3 seconds 2 bars converge on the display (Countdown).

At the Configuration level the operating parameters can be input or changed, auxiliary functions supplemented or the automatic adjustment (X.TUNE) of the controller started.

A precise description of the individual functions can be found in the chapters entitled “Start-up, operation of the position controller Type 8692” - “Specifying the basic settings” and in "Configuring the auxiliary functions".

Fig. 16: Description of the control module

Configuration level -> Process operating level

Press the left selection key (EXIT) to switch from the Configuration level to the Process operating level. In doing so, the operating state which was selected before the switchover (AUTOMATIC or MANUAL) is set.
3.3 AUTOMATIC operating state

Bar running from left to right along the upper edge of the display.
Normal control mode is implemented and monitored in AUTOMATIC operating state.

3.3.1 Meaning of the keys

<table>

3.3.4 Manually Changing the Process set-point value

If the auxiliary function P.CONTROL / SETUP / SP INPUT / internal (set the set-point value via keys) is specified during the configuration, the menu to change the process set-point value can be activated when the SP (Setpoint) display is set by pressing the right selection key (INPUT). The individual digits can be set by pressing the arrow keys. Press the right selection key (OK) to accept the set value.

Fig. 18: Setting numerical values SP

* Displayed only when P.CONTROL auxiliary function activated.

** Only active if the internal set-point value default (P.CONTROL / SETUP / SP INPUT / internal) has been selected.
3.4 MANUAL operating state

Without bar running from left to right along the upper edge of the display.
In MANUAL operating state the valve can be opened or closed manually.

3.4.1 Meaning of the keys

SFA: Actuator closes by spring force
SFB: Actuator opens by spring force
SFI: Actuator double-acting

3.4.2 Information on the Display

After switching to the MANUAL operating state, the display automatically jumps to the actual position (POS) of the valve actuator.

3.4.3 Operating structure

![Operating structure MANUAL](Fig. 19: Operating structure MANUAL)

* only if "Fall" is set in the DIR.ACT auxiliary function
4 AUXILIARY FUNCTIONS FOR THE PROCESS CONTROLLER

In this chapter only those auxiliary functions are described which differ from the position controller Type 8692. All other auxiliary functions and their settings can be found in the chapters entitled "Start-up, operation of the position controller Type 8692" - "Configuring the auxiliary functions".

4.1 Overview of the auxiliary functions

![Diagram of auxiliary functions]

- **ADD.FUNCTION**: Enter
- **CHARACT**: Selection of the transfer characteristic between input signal and stroke (correction characteristic)
- **CUTOFF**: Sealing function for position controller
- **DIR.CMD**: Effective sense of direction between input signal and nominal position
- **DIR.ACT**: Assignment of the aeration state of the drive chamber to the actual position
- **SPLTRNG ***: Signal split range; input signal as % for which the valve runs through the entire stroke range.
- **X.LIMIT**: Limit of the mechanical stroke range
- **X.TIME**: Limiting the control speed
- **X.CONTROL**: Parameterisation of the position controller
- **P.CONTROL**: Parameterisation of the PID process controller
- **SECURITY**: Code protection for settings
- **SAFEPOS**: Input the safety position
- **SIG.ERROR**: Configuration of signal level fault detection
- **BINARY. IN**: Activation of the binary input
- **OUTPUT**: Configuration of the outputs (option only)
- **CAL.USER**: Calibration
- **SET.FACTORY**: Reset to factory settings
- **SER. I / O**: Configuration of serial interface
- **EXTRAS**: Set colours on display
- **SERVICE**: For internal use only

* SPLTRNG auxiliary function can only be selected if P.CONTROL auxiliary function is inactive.
If the P.CONTROL auxiliary function is active for the process controller Type 8693, the following auxiliary functions differ from those described for the position controller Type 8692 (highlighted in Fig. 20):

- CUTOFF
- SECURITY
- SIG.ERROR
- OUTPUT
- CAL USER

4.1.1 Including auxiliary functions in the main menu

→ Press the arrow keys to select the ADD.FUNCTION menu option in the main menu and press the right selection key (ENTER) to enter the submenu.
→ Press the arrow keys to select the required auxiliary function.
→ Press the selection key on the right (ENTER) to mark the auxiliary function with a cross (x).
→ All marked functions are transferred to the main menu when the selection key on the left (EXIT) is pressed.
→ In the main menu input the parameters of the auxiliary functions.

4.1.2 Removing auxiliary functions from the main menu

If a function is removed from the main menu, the settings implemented previously under this function become invalid again.

→ Press the arrow keys to select the ADD.FUNCTION menu option in the main menu.
→ Enter the submenu by pressing the selection key on the right (ENTER).
→ Press the arrow keys to select an auxiliary function indicated with a cross (x).
→ Press the selection key on the right (ENTER) to remove the cross (x).
→ After pressing the selection key on the left (EXIT), the auxiliary function is deactivated and removed from the main menu.

A precise description on the operation of the auxiliary functions can be found in the chapters entitled “Start-up, operation of the position controller Type 8692” - “Specifying the basic settings” and in “Configuring the auxiliary functions”.

4.2 CUTOFF
Sealing function for the position controller Type 8693

This function causes the valve to be sealed outside the control area.

This is where you input the limits for the position set-point value (CMD) as a percentage or for the process set-point value (SP) as a percentage of the scaling range, from which the actuator is fully deaerated or aerated. Control mode opens or resumes at a hysteresis of 1%. If the process valve is in the sealing area, the message "CUTOFF ACTIVE" is indicated on the display.

Factory setting: Min = 0%; Max = 100%; CUT type = Type PCO

![Diagram of CUTOFF-8693](image)

Fig. 21: Operating structure CUTOFF-8693

Changed values are not transferred into the memory (EEPROM) until the main menu (MAIN) is left.

![Graph of CUTOFF-8693](image)

Fig. 22: Graph - CUTOFF - 8693

* If the sub-menu is left by pressing the selection key on the left (ESC), the value remains unchanged.
4.3 SECURITY
Code protection for the settings

Use the SECURITY function to prevent the positioner or individual functions from being accessed unintentionally.

Factory setting: Access Code: 0000

If the code protection is activated, the code (set access code or master code) must be input whenever operator action is disabled.

All operator actions can be implemented with the non-changeable master code. This 4-digit master code can be found in the appendix of these operating instructions in the chapter entitled "Master code".

Input screen for inputting or changing the CODE (for description of input see below)

Blocking access to the configuration level

Blocking switchover between the MANUAL / AUTOMATIC (MANU/AUTO) operating states

Blocking the input of auxiliary functions

Blocking the activation of self-parameterisation (Autotune)

Blocking the activation of the linearisation of the process characteristic

Inputting the code:

Press the selection key on the right (INPUT) to access the input screen when the CODE selection menu is marked.

The code consists of four digits which can be changed individually by pressing the up arrow key (↑).

Press the down arrow key (↓) to jump between the individual digits.

Press the selection key on the left (ESC) to leave the input screen without change.

Press the selection key on the right (OK) to leave the input screen and save the input or change.
4.4 SIG-ERROR
Configuration of signal level fault detection

The SIG-ERROR function is used to detect a fault on the input signal.

![Diagram](image)

Fig. 24: Operating structure SIG-ERROR-8693

The operating structure of the menu options SP/CMD Input and PV Input is identical and is described in the diagram below:

![Diagram](image)

Fig. 25: Operating structure SIG-ERROR-8693-SP-CMD-PV

If signal fault detection is activated, the respective fault is indicated on the display.

(see chapter entitled "Maintenance and troubleshooting")
**Fault detection**
Fault detection can be selected at 4 – 20 mA and with a PT100 signal.

- **4 – 20 mA**
  - Fault with input signal ≤ 3.5 mA (± 0.5 % of end value, hysteresis 0.5 % of end value)
- **PT100**
  - Fault with input signal 225 °C (± 0.5 % of end value, hysteresis 0.5 % of end value)

If other signal types are selected or if process controllers are not activated, the respective menu branch is hidden. If this configuration does not allow either of the two fault detections, *not available* is indicated in the selection menu.

**Safety position SAFEPoS on**
When SAFEPoS on is set, the following configurations may occur:

- **Active SAFEPoS** menu option: If a fault is detected, the actuator moves to the lower SAFEPoS set position.
- **Inactive SAFEPoS** menu option: If a fault is detected, the actuator moves to the end position which it would specify in the isolated state.

### 4.5 OUTPUT (option)
**Configuring the outputs**

The OUTPUT menu option is only indicated in the selection menu of *ADD.FUNCTION* if the positioner has outputs (option).

**The outputs can be used for the following feedback signals:**
- **Analogue output:** Feedback of the current position (POS), the position set-point value (CMD), the process actual value (PV) or the process set-point value (SP) to the control centre.
- **Binary outputs:** Alarm output for excessively large control deviations of the position controller or for the output of the current position with respect to a specified limit position (> or <) or for the output: actuator in safety position or for the output of a sensor break or for the output: operating state AUTOMATIC / MANUAL.

**The positioner which has the outputs option is available in the following versions:**
- one analogue output
- one analogue and two binary outputs
- two binary outputs

According to the version of the positioner, only the possible adjustable outputs (*ANALOGUE, ANALOGUE + BIN 1 + BIN 2* or *BIN 1 + BIN 2*) are indicated in the OUTPUT menu option.

---

**Fig. 26: Operating structure OUTPUT**

1. Configuration of the analogue output
2. Configuration of the binary output 1
3. Configuration of the binary output 2
OUT ANALOG - Configuration of the analogue output

Only for the versions:
• one analogue output
• one analogue output and two binary outputs

The feedback of the current position (POS), the position set-point value (CMD), the process actual value (PV) or the process set-point value (SP) can be transmitted to the control centre via the analogue output.

Fig. 27: Operating structure OUTPUT-ANALOGUE-8693

Changed values are not transferred into the memory (EEPROM) until the main menu (MAIN) is left.
**OUT BIN1** - Configuration of the binary output 1

**OUT BIN2** - Configuration of the binary output 2

Only for the versions:
- one analogue output and two binary outputs
- two binary outputs

The following description applies to both binary outputs **OUT BIN 1** and **OUT BIN 2**.

The binary outputs 1 and 2 can be used for one of the following outputs:
- for the output: alarm output for excessively large control deviations of the position controller
- for the output: actuator in safety position
- for the output: sensor break process set-point value
- for the output: sensor break process actual value
- for the output: operating state MANUAL / AUTOMATIC.

Fig. 28: Operating structure OUTPUT-BIN1-8693

Normally closed output, in switched state low (≅ 0 V)

Normally opened output, in switched state high (≅ 24 V)

* If the sub-menu is left by pressing the selection key on the left (ESC), the value remains unchanged.

** The permitted control deviation Lim DEV.X XX must not be less than the dead band.

*** only possible if signal level fault detection activated (see chapter entitled “SIG-ERROR”)
Alarm output for excessively large control deviation of the position controller: **OUT DEV.X**

→ Press the arrow keys to mark the **OUT DEV.X** menu option and confirm with the selection key on the right (SELEC).

→ Press the arrow keys to input the limit value for the permitted control deviation in the Lim. DEV.X 1.0% menu option and accept with the selection key on the right (OK).

⚠️ The permitted control deviation Lim. DEV.X XX must not be less than the dead band.

→ In the **OUT BIN type** menu option input the required switching status (normally opened / normally closed)*.

**Output of the current position with respect to a specified limit position: **OUT POS**

→ Press the arrow keys to mark the **OUT POS** menu option and confirm with the selection key on the right (SELEC).

→ Press the arrow keys to input the value of the limit position in the Lim. POS 0% menu option and accept with the selection key on the right (OK).

→ In the **OUT BIN type** menu option input the required switching status (normally opened / normally closed).

<table>

**Output of message: Actuator in safety position: **OUT Safepos**

→ Press the arrow keys to mark the **OUT Safepos** menu option and confirm with the selection key on the right (SELEC).

→ In the **OUT BIN type** menu option input the required switching status (normally opened / normally closed).

**Output sensor break: **OUT ERR SP/CMD***

→ Press the arrow keys to mark the **OUT ERR SP/CMD** menu option and confirm with the selection key on the right (SELEC).

→ In the **OUT BIN type** menu option input the required switching status (normally opened / normally closed).

**Output sensor break: **OUT ERR PV***

→ Press the arrow keys to mark the **OUT ERR PV** menu option and confirm with the selection key on the right (SELEC).

→ In the **OUT BIN type** menu option input the required switching status (normally opened / normally closed).

**Output operating state AUTOMATIC / MANUAL: **OUT remote**

→ Press the arrow keys to mark the **OUT remote** menu option and confirm with the selection key on the right (SELEC).

→ In the **OUT BIN type** menu option input the required switching status (normally opened / normally closed).

⚠️ Normally closed output, in switched state low (≤ 0 V)  
Normally opened output, in switched state high (≥ 24 V)

* only possible if signal level fault detection activated (see chapter entitled "SIG-ERROR")
4.6 CAL.USER
Calibrating the actual value display and the inputs for the process values

The following points can be manually calibrated with this function:

- Position display (POS) 0 – 100%
- Process set-point value display (SP)***
- Process actual value display (PV)

![Diagram showing the calibration process](image)

Fig. 29: Operating structure CAL.USER-8693

Remove the CAL.USER auxiliary function to re-activate the factory calibration.

---

* If the sub-menu is left by pressing the selection key on the left (ESC), the value remains unchanged.
** The signal type is displayed which is selected in the INPUT menu (4 – 20 mA; 0 – 20 mA; 0 – 5 V; 0 – 10 V).
*** Only if external set-point value default is set in the P.CONTROL / SETUP / SP-INPUT
Procedure:

Calibrating the actual value display \textit{POS} (0 - 100 \%): \textit{calibr. POS}

→ In the \textit{CAL. USER} menu press the arrow keys to select the \textit{calibr. POS} menu option and confirm with the selection key on the right (ENTER).

Accept the minimum position:
→ Press the arrow keys to select the \textit{POS lower X} menu option and confirm with the selection key on the right (INPUT).
→ Approach the minimum position of the valve using the arrow keys (OPN/CLS) and confirm this value by pressing the selection key on the right (OK).

Accept the maximum position:
→ Press the arrow keys to select the \textit{POS upper X} menu option and confirm with the selection key on the right (INPUT).
→ Approach the maximum position of the valve using the arrow keys (OPN/CLS) and confirm this value by pressing the selection key on the right (OK).

Calibrating the process set-point value (4 – 20 mA; 0 – 20 mA; 0 – 5 V; 0 – 10 V): \textit{calibr. SP}***

→ In the \textit{CAL. USER} menu press the arrow keys to select the \textit{calibr. SP} menu option and confirm with the selection key on the right (ENTER).

Accept the minimum input signal (0 mA; 4 mA; 0 V)**:
→ Press the arrow keys to select the \textit{SP (0 mA; 4 mA; 0 V)} menu option and confirm with the selection key on the right (INPUT).
→ Apply the minimum value of the unit signal on the input and confirm by pressing the selection key on the right (OK).

Accept the maximum input signal (20 mA; 5 V; 10 V)**:
→ Press the arrow keys to select the \textit{SP (20 mA; 5 V; 10 V)} menu option and confirm with the selection key on the right (INPUT).
→ Apply the maximum value of the unit signal on the input and confirm by pressing the selection key on the right (OK).

Calibrating the process actual value (4 – 20 mA or PT 100): \textit{calibr. PV} 

\begin{enumerate}
\item 4 – 20 mA:
\end{enumerate}

---

* If the sub-menu is left by pressing the selection key on the left (ESC), the value remains unchanged.
** The signal type is displayed which is selected in the \textit{INPUT} menu (4 – 20 mA; 0 – 20 mA; 0 – 5 V; 0 – 10 V).
*** Only if external set-point value default is set in the \textit{P.CONTROL / SETUP / SP-INPUT}.
Accept the maximum input signal (20 mA):
→ Press the arrow keys to select the PV 20 mA menu option and confirm with the selection key on the right (INPUT).
→ Apply the maximum value of the unit signal on the input and confirm by pressing the selection key on the right (OK).

2 PT 100:

![Operating structure CAL.USER-8693-PV-PT100]

An offset value calculated from the actual value and the new value is added to all calculated values.

→ Press the right selection key (INPUT) to enter the input screen for PT 100.
On the display the last digit of the new value is highlighted with a dark background.
→ Press the up arrow key (+) to specify the individual digits of the value and switch to the next digit with the down arrow key (→).
→ When all input values have been specified, confirm by pressing the right selection key (OK) and jump back to the selection screen.

Resetting the settings under CAL.USER to the factory settings: copy FACT→USER

→ In the CAL.USER menu press the arrow keys to select the copy FACT→USER menu option and confirm with the selection key on the right (ENTER).
→ Hold down the selection key on the right (RUN) (for approx. 3 seconds) until the countdown has elapsed.

* If the sub-menu is left by pressing the selection key on the left (ESC), the value remains unchanged.

The following sections of the general operating instructions do not apply to the positioner with PROFIBUS-DP:

- Variants of the positioner
- Initial start-up
- Electrical connection
- Specifying the standard settings
  - Function INPUT
  - Function SPLTRNG
  - Function BINARY-IN
  - Function OUTPUT
  - Function CAL.USER / calibr. INP
  - Function CAL.USER / calibr. SP

2 TECHNICAL DATA

The protocol sequence complies with the standard DIN 19245 Part 3.

GSD file BUE2C630.GSD

Bitmap files BUE2C630.BMP

PNO-ID C630 Hex

Baudrate max. 12 Mbaud
(is set automatically by the positioner)

Sync and Freeze modes are not supported

Diagnosis telegram No device-specific diagnosis

Parameter telegram No user parameters

The process data is configured in the positioner and in the PROFIBUS master. Maximum 10 process values (total INPUT and OUTPUT) can be transferred.
3 SAFETY SETTINGS IF THE BUS FAILS

The position is approached which corresponds to the set-point value last transferred (default setting).

Other setting options (see chapter entitled Settings on the positioner).

4 INTERFACES

* only for process controller Type 8693
5 ELECTRICAL CONNECTIONS

DANGER!

Danger - electrical voltage in the equipment!
There is a serious risk of injury when reaching into the equipment.
- Before starting work, always switch off the power supply and safeguard to prevent re-activation!

WARNING!

Danger - improper installation!
Improper installation may result in injuries as well as damage to the device and the area around it.
- Fluid and electrical installations may be carried out by authorised technicians only and with the appropriate tools!

Danger due to unintentional activation of the equipment!
Unintentional activation of the equipment during installation may result in injuries and damage.
- Take appropriate measures to prevent the equipment from being unintentionally activated.

→ For operation of the device always connect the 5-pole, inversely coded M12 round socket and the 4-pole M12 round plug (power supply).
The connection module of Type 8692 and 8693 features a setscrew with nut which is used to connect the Technical Earth (see diagram).
→ Connect the setscrew to a suitable earthing point.
To ensure electromagnetic compatibility (EMC), ensure that the cable is as short as possible (max. 30 cm, Ø 1.5 mm²).

---

* Can be adjusted by software (see chapter entitled “Procedure for Specifying the Basic Settings”)

** The switch is situated behind the screw (see Fig. “Connection Profibus 8693”)

---

For reasons of wire compensation connect the Pt -100 sensor via 3 wires. Always bridge PIN 3 and PIN 4 on the sensor.
Chapter 6: Settings on the Positioner

The specification of the basic settings on the positioner can be found in the following chapters:

- Type 8692: "Starting up and operating the position controller Type 8692" / "Starting up and setting up the position controller Type 8692"
- Type 8693: "Starting up and operating the position controller Type 8693" / "Starting up and setting up the process controller Type 8693"

Specify the basic settings on the positioner (ACTUATOR and X.TUNE).

Implement the settings in the BUS.COMM menu option as described in the chapter entitled "Explanations of the menu options in the BUS.COMM menu".

Fig. 4: Operating structure - basic settings - PROFIBUS
6.1 Explanations of the Menu Options in the BUS.COMM Menu

6.1.1 BUS.COMM Menu for Type 8692

Fig. 5: Operating structure - BUS-COMM
6.1.2 BUS.COMM Menu for Type 8693

**Fig. 6: Operating structure - BUS-COMM - 8693**

* only when process controller activated

** only when process controller activated, otherwise CMD
1. **Address XXX**
   - Input the device address
   - Press the arrow keys (+/-) to set values from 0 – 126;
   - Confirm by pressing the selection key on the right (OK).

2. **BUS FAIL**
   - **SafePos off**
     - The position is approached which corresponds to the set-point value last transferred.
     - (Default setting)
   - **SafePos on**
     - If SafePos on is set, the following configurations may occur:
       - Active SAFEPOS
         - menu option If a fault is detected in the bus communication, the drive moves to the lower SAFEPOS set position.
       - Inactive SAFEPOS
         - menu option If a fault is detected in the bus communication, the drive moves to the end position which it would specify in the isolated state.

3. **BUS PDI**
   - Selection of the process values which are to be transferred by the positioner to the controller (master).
   - Press the selection key on the right (ENTER) either to activate (x) or deactivate ( ) the respective process value.
   - For meaning of the process values see table PDI: Process Data Input.

4. **BUS PDO**
   - Selection of the process values which are to be transferred by the controller (master) to the positioner.
   - Press the selection key on the right (ENTER) either to activate (x) or deactivate ( ) the respective process value.
   - For meaning of the process values see table PDO: Process Data Output.

---

**7 FUNCTIONAL DEVIATIONS FROM THE STANDARD MODEL**

It is possible to switch between the MANUAL and AUTOMATIC operating states on the process operating level either via the keyboard on the positioner or via the bus.

It is no longer possible to switch between MANUAL / AUTOMATIC on the keyboard if an operating mode (under PDO MODE) is transferred to the positioner via the bus.

---

* only for type 8693 and when process controller activated
** only for type 8693
8 CONFIGURATION IN THE PROFIBUS-DP MASTER

User parameters (hexparameters) are not required.

8.1 Configuration of the Process Values
Firstly the PDI (Process Data Input) is input (from the positioner to the controller).

**PDI: Process Data Input**  (from the positioner to the controller)

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Identifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>PDI:POS</td>
<td>Actual position (position)</td>
<td>GSD file: PDI:POS Identifier (HEX): 41, 40, 00</td>
</tr>
<tr>
<td>PDI:CMD</td>
<td>Nominal position (command)</td>
<td>GSD file: PDI:CMD Identifier (HEX): 41, 40, 01</td>
</tr>
<tr>
<td>PDI:PV</td>
<td>Process actual value (process value)</td>
<td>GSD file: PDI:PV Identifier (HEX): 41, 40, 02</td>
</tr>
<tr>
<td>PDI:SP</td>
<td>Process set-point value (setpoint)</td>
<td>GSD file: PDI:SP Identifier (HEX): 41, 40, 03</td>
</tr>
<tr>
<td>PDI:TEMP</td>
<td>Device temperature (temperature)</td>
<td>GSD file: PDI:TEMP Identifier (HEX): 41, 40, 04</td>
</tr>
<tr>

10 CONFIGURATION WITH SIEMENS STEP7

10.1 Example 1 for a Position controller (Type 8692):
Transfer of nominal and actual values

Procedure:

→ pull the slave Type 8692 / 8693 by Drag & Drop to the bus line.

→ pull the modules PDI:POS and PDO:CMD/SP into the slave Type 8692 / 8693 by Drag & Drop.
10.2 Example 2 for a Position controller (Type 8693): Transfer of several process values.

Procedure as in example 1.

→ pull the slave Type 8692 / 8693 by Drag & Drop to the bus line.

→ pull the modules into the slave Type 8692 / 8693 by Drag & Drop.

1 GENERAL INFORMATION

The following sections of the general operating instructions do not apply to the DeviceNet variant of the positioner 8692 / 8693:

- Variants of the positioner
- Initial start-up
- Electrical connection
- Specifying the standard settings

Function INPUT
Function SPLTRNG
Function BINARY-IN
Function OUTPUT
Function CAL.USER / calibr. INP
Function CAL.USER / calibr. SP

2 DEFINITION OF TERMS

DeviceNet

- The DeviceNet is a field bus system which is based on the CAN protocol (Controller Area Network). It enables actuators and sensors (slaves) to be networked with higher-level controllers (master).
- The positioner in the DeviceNet is a slave device according to the Predefined Master/Slave Connection Set stipulated in the DeviceNet specification. Polled I/O, Bit Strobed I/O and Change of State (COS) are supported as an I/O connection variant.
- With DeviceNet it is necessary to differentiate between cyclical or event-driven high-priority process messages (I/O Messages) and acyclical low-priority management messages (Explicit Messages).
- The protocol process conforms to the DeviceNet specification Release 2.0.

3 TECHNICAL DATA

EDS file | BUER8692.EDS

Icons | BUER8692.ICO

Baudrate | 125 kbit/s, 250 kbit/s, 500 kbit/s (can be adjusted by pressing operator keys on the device or via network); Factory setting 125 kbit/s

Address | 0 – 63; (can be adjusted by pressing operator keys on the device or via network); Factory setting 63

Process data | 7 static input assemblies
(Input: from the positioner to the DeviceNet master/scanner)
4 static output assemblies
**Total line length** according to DeviceNet Specification
(Total line length = total of all trunk and drop lines)

### 4 SAFETY SETTINGS IF THE BUS FAILS

If the bus fails, the position is approached which corresponds to the set-point value last transferred (default setting).

Other setting options (see chapter entitled "Settings on the positioner").

### 5 INTERFACES

*only for process controller Type 8693*
6 ELECTRICAL CONNECTIONS

DANGER!

Danger - electrical voltage in the equipment!
There is a serious risk of injury when reaching into the equipment.
- Before starting work, always switch off the power supply and safeguard to prevent re-activation!

WARNING!

Danger - improper installation!
Improper installation may result in injuries as well as damage to the device and the area around it.
- Fluid and electrical installations may be carried out by authorised technicians only and with the appropriate tools!

Danger due to unintentional activation of the equipment!
Unintentional activation of the equipment during installation may result in injuries and damage.
- Take appropriate measures to prevent the equipment from being unintentionally activated.

→ For operation of the device always connect the 5-pole (bus) and the 4-pole M12 round plug (power supply).
The connection module of Type 8692 and 8693 features a setscrew with nut which is used to connect the Technical Earth (see diagram).

→ Connect the setscrew to a suitable earthing point.
To ensure electromagnetic compatibility (EMC), ensure that the cable is as short as possible (max. 30 cm, Ø 1.5 mm²).

6.1 Connection Diagram Type 8692

![Connection Diagram Type 8692](image)

Fig. 2: Connection of DeviceNet-8692
6.2 Connection Diagram Type 8693

Fig. 3: Connection of DeviceNet-8693

The power supply to the device is not supplied via the DeviceNet voltage V+ und V-, but via the operating voltage galvanically isolated from the DeviceNet.

</tbody>
</table>

* Can be adjusted by software.

** The switch is situated behind the screw (see Fig. “Connection of DeviceNet-8693”).

---

**For reasons of wire compensation connect the Pt 100 sensor via 3 wires.**

* Always bridge PIN 3 and PIN 4 on the sensor.*

### 6.6 Terminating Circuit for DeviceNet Systems

When installing a DeviceNet system, ensure that the terminating circuit of the data lines is correct. The circuit prevents the occurrence of interference caused by signals reflected onto the data lines. The trunk line must be terminated at both ends with resistors of 120 Ω each and 1/4 W power loss.

(see figure 4: Network topology, DeviceNet)
6.7 Network Topology of a DeviceNet System

Line with one trunk line and several drop lines.
Trunk lines and drop lines consist of identical material (see diagram).

![Network topology, DeviceNet](image)

* not assigned, as separate power supply
7 SETTINGS ON THE POSITIONER IN THE MAIN MENU

The specification of the basic settings on the positioner can be found in the following chapters:

- Type 8692: "Starting up and operating the position controller Type 8692" / "Starting up and setting up the position controller Type 8692"
- Type 8693: "Starting up and operating the position controller Type 8693" / "Starting up and setting up the process controller Type 8693"

Specify the basic settings on the positioner (ACTUATOR and X.TUNE).

Implement the settings in the BUS.COMM menu option as described in the chapter entitled "Explanations of the menu options in the BUS.COMM" menu.

Fig. 5: Operating structure of basic settings, DeviceNet
7.1 Explanations of the Menu Options in the BUS.COMM Menu

1. **Address XXX**
   - Input the device address
   - Press the arrow keys (+/-) to set values from 0 – 63;
   - Confirm by pressing the selection key on the right (OK).

2. **BAUDRATE**
   - The baudrate can be changed either by pressing the operator keys on the device or via the bus.
   - In either case a change has no effect until a reset (send a reset message to the identity object) or power up is implemented. This means if the changed baudrate attribute is accessed before a reset or power up, the read (changed) value does not agree with the still current baudrate (to be changed) of the network.
   - Select 125 kbit/s, 250 kbit/s or 500 kbit/s

3. **BUS FAIL**
   - Activate to approach the safety position if the bus communication fails.
   - The position is approached which corresponds to the set-point value last transferred.
   - (Default setting)
   - If SafePos on is set, the following configurations may occur:
     - Active SAFEPOS menu option if a fault is detected in the bus communication, the actuator moves to the lower SAFEPOS set position.
     - Inactive SAFEPOS menu option if a fault is detected in the bus communication, the actuator moves to the end position which it would specify in the isolated state.

*If the sub-menu is left by pressing the selection key on the left (ESC), the value remains unchanged.*
8 FUNCTIONAL DEVIATIONS FROM THE STANDARD MODEL

It is possible to switch between the MANUAL and AUTOMATIC operating states on the process operating level either via the keyboard on the positioner or via the bus.
It is no longer possible to switch between MANUAL / AUTOMATIC on the keyboard if an operating mode (under PDO MODE) is transferred to the positioner via the bus.

9 CONFIGURATION OF THE PROCESS DATA

To transmit process data via an I/O connection, 5 static input and 2 static output assemblies can be selected. These assemblies contain selected attributes combined into one object so that process data can be transmitted collectively via an I/O connection.
The process data is selected by setting the device parameters Active Input Assembly and Active Output Assembly or - if supported by the DeviceNet-Master/Scanner - by setting Produced Connection Path and Consumed Connection Path when an I/O connection is initialised according to the DeviceNet specification.

9.1 Static Input Assemblies

<table>
<thead>
<tr>

| PV+SP+CMD+ERR               | 4, 5, 3                                                                                 | Byte 0: PV low
|                             |                                                                                         | Byte 1: PV high
|                             |                                                                                         | Byte 2: SP low
|                             |                                                                                         | Byte 3: SP high
|                             |                                                                                         | Byte 4: CMD low
|                             |                                                                                         | Byte 5: CMD high
|                             |                                                                                         | Byte 6: ERR                  |

The addresses indicated in the Static Input Assemblies table can be used to specify a path for the Produced Connection Path attribute of an I/O connection, whereby the attributes described in more detail in the following table can be transferred as input process data via this I/O connection. Nevertheless, by using this address data, the attributes combined in the assemblies can also be accessed acyclically via Explicit Messages.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description of the input data attributes</th>
<th>Attribute Address Class, Instance, Attribute; Data type, Length</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>POS</strong></td>
<td>Actual position &lt;br&gt;Actual value of position controller as %o. Value range 0–1000. However, values &lt;0 or &gt;1000 also possible if e.g. Autotune has not run through correctly.</td>
<td>111, 1, 59; INT, 2 byte</td>
</tr>
<tr>
<td><strong>CMD</strong></td>
<td>Nominal position &lt;br&gt;Set-point value of position controller as %o. Value range 0–1000.</td>
<td>111, 1, 58; UINT, 2 byte</td>
</tr>
<tr>
<td><strong>PV</strong></td>
<td>Process actual value (process value) &lt;br&gt;Actual value of process controller in physical unit (as set in the menu P.CO INP or P.CO SCAL), max. value range –999–9999, depending on internal scaling.</td>
<td>120, 1, 3; INT, 2 byte</td>
</tr>
<tr>
<td><strong>SP</strong></td>
<td>Process set-point value &lt;br&gt;Set-point value of process controller in physical unit (as set in the menu P.CO INP or P.CO SCAL), max. value range –999–9999, depending on internal scaling.</td>
<td>120, 1, 2; INT, 2 byte</td>
</tr>
<tr>
<td><strong>ERR</strong></td>
<td>Error &lt;br&gt;Indicates the number of the process value (output) which was not written. The value is retained until it is deleted with &quot;1&quot; by acyclically writing the &quot;Error&quot; attribute (access via Explicit Message – Set Attribute Single).</td>
<td>100, 1, 1; USINT, 1 byte</td>
</tr>
</tbody>
</table>

*relevant only for type 8693 and when process controller activated.*
9.2 Static Output Assemblies

<table>
<thead>
<tr>
<th>Name</th>
<th>Address of data attribute of the assemblies for read access. Class, Instance, Attribute</th>
<th>Format of the data attribute</th>
</tr>
</thead>
</table>
| INP (factory setting) | 4, 21, 3 | Byte 0: INP low  
Byte 1: INP high |
| SP            | 4, 22, 3 | Byte 0: SP low  
Byte 1: SP high |

The addresses indicated in the Static Output Assemblies table can be used to specify a path for the Consumed Connection Path attribute of an I/O connection, whereby the attributes described in more detail in the following table can be transferred as output process data via this I/O connection. Nevertheless, by using this address data, the attributes combined in the assemblies can also be accessed acyclically via Explicit Messages.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description of the output data attributes</th>
<th>Attribute Address Class, Instance, Attribute; Data type, Length</th>
</tr>
</thead>
</table>
| INP  | Nominal position  
Set-point value of position controller as %. Value range 0–1000. In "pure" position controller mode (P.CONTRL inactive) the transfer of the nominal position INP is required; as a process controller (PCONTRL active) the transfer of INP is not possible. If the value is too small or too large, the last valid value is used and is indicated in ERR with HEX 14. | 111, 1, 58;  
UINT, 2 byte |
| SP   | Process set-point value  
Set-point value of process controller in physical unit (as set in the menu P.CO INP or P.CO SCAL), max. value range –999–9999, depending on internal scaling.  
If the value is too small or too large, the last valid value is used and is indicated in ERR with HEX 15. | 120, 1, 2;  
INT, 2 byte |

* relevant only for type 8693 and when process controller activated.
10 BUS STATUS DISPLAY

The bus status is indicated on the display on the device.

<table>
<thead>
<tr>
<th>Display</th>
<th>Device status</th>
<th>Explanation/Troubleshooting</th>
</tr>
</thead>
</table>
| **BUS offline**          | offline                       | Device is not connected to the bus, the network access procedure (duplicate MAC-ID test, duration approx. 2 s) has still not ended or device is only active network node  
  is displayed approx. every 3 seconds | • Baudrate correctly set across network?  
  • Bus connection including plug assignment correct?  
  • Power supply and bus connection of the other nodes correct? |
| **BUS no connection**    | online, no connection to the master | Device is connected correctly to the bus, the network access procedure has ended without errors, however there is no established connection to the master.  
  is displayed approx. every 3 seconds |
| **BUS no timeout**       | I/O connection timeout        | An I/O connection is in the **TIME OUT** state.  
  is displayed approx. every 3 seconds | → New connection establishment by master; ensure that I/O data is transferred cyclically or, if **COS** confirmed, that corresponding Acknowledge messages are sent by the master. |
| **BUS critical err**     | Critical bus error            | Other device with the same address in the network or **BUS OFF** due to communication problems.  
  is displayed approx. every 3 seconds | → Change address of the device and restart device  
  → Error analysis in the network with a bus monitor. |
11 CONFIGURATION EXAMPLE 1

The example describes the principle procedure when configuring the device using the software RSNetWorx for DeviceNet (Rev. 4.12.00).

11.1 Installation of the EDS File

The EDS file supplied on the CD is installed with the aid of the EDS Installation Wizard Tool associated with RSNetWorx.

During the installation procedure the icon also supplied on CD can be assigned (if this does not occur automatically).

11.2 Address Assignment

There are two options of assigning an address to the devices.

On the one hand the address can be set by pressing the operator keys on the device to the required value within the range 0 – 63 (see chapter entitled Settings on the positioner), on the other hand the address can be changed from connected devices via the bus with the aid of the Node Commissioning Tool associated with RSNetWorx. Therefore devices with the default address 63 can also be inserted sequentially into an existing network without difficulty.

Fig. 7 indicates how the new address 2 is assigned to a device with address 63.
11.3 Offline Parameterisation of the Device

When a device has been inserted into the DeviceNet configuration of RSNetWorx, the device can be parameterised offline.

Fig. 8 indicates how, for example, an input assembly which deviates from the factory setting (input process data can be transferred via I/O connection) can be selected. However, ensure that the length of the process data during a subsequent configuration of the DeviceNet master/scanner is adjusted accordingly (see chapter entitled Configuration Example 2).

All parameter changes implemented offline must become operative for the real device at a later date by a download process.

Fig. 8: Screenshot - DeviceNet - Fig. 2
10.4 Offline Parameterisation of the Device

Devices can also be parameterised online. In doing so, you can also select whether only individual parameters (single) or all parameters (all) of a group are read from the device (upload) or are loaded into the device (download).

It is also possible to transfer individual parameters or all parameters of a group cyclically in monitor mode. This may be helpful particularly for start-up purposes.

Fig. 9 indicates the group of the process values or diagnosis information. If Monitor is actuated, these values are updated cyclically. However, Explicit Messages are used for this cyclical access (no I/O connections).
12 CONFIGURATION EXAMPLE 2

This example describes the principle procedure for setting up the process image of a DeviceNet master/scanner using the software RSNetWorx for DeviceNet (Rev. 4.12.00).

Setting up the scan list and setting the I/O parameters
First of all the scan list of the DeviceNet master/scanner is set up. To do this, the devices listed in the left part of the corresponding window are included in the scan list in the right part of the window. Then the I/O parameters can be changed for each device included in the scan list. This is required if assemblies which differ from the default settings were selected during configuration of the positioner in question.

Fig. 10 indicates the setting of the I/O parameters when

**Input Assembly**  
POS+CMD+ERR (5 bytes long) is selected and when

**Output Assembly**  
INP (2 bytes long; Default Assembly - no change required) is selected

Fig. 10: Screenshot - DeviceNet - Fig. 4
12.1 Setting up the Process Image (Mapping)

The AUTOMAP function is used to assign the input data of the devices specified in the scan list to the process image of the DeviceNet master/scanner.

Our example of the assignment is indicated in Fig. 11.
For example the input process values of the positioner with address 3 are assigned to the internal addresses of the scanner as follows:

<table>
<thead>
<tr>
<th>Actual position</th>
<th>I:1.1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nominal position</td>
<td>I:1.2</td>
</tr>
<tr>
<td>Error</td>
<td>I:1.3</td>
</tr>
</tbody>
</table>

Therefore, if the actual position of the positioner with address 3 is to be read from a control program, this is done by accessing I:1.1.

1 SELECTION CRITERIA FOR CONTINUOUS VALVES

The following criteria are crucial for optimum control behaviour and to ensure that the required maximum flow is reached:

- the correct selection of the flow coefficient which is defined primarily by the nominal width of the valve;
- close coordination between the nominal width of the valve and the pressure conditions in consideration of the remaining flow resistance in the equipment.

Design guidelines can be given on the basis of the flow coefficient \((k_v\) value). The \(k_v\) value refers to standardised conditions with respect to pressure, temperature and media properties.

The \(k_v\) value describes the flow rate of water through a component in \(m^3/h\) at a pressure difference of \(\Delta p = 1\) bar and \(T = 20^\circ C\).

The “\(k_{VS}\) value” is also used for continuous valves. This indicates the \(k_v\) value when the continuous valve is fully open.

Depending on the specified data, it is necessary to differentiate between the two following cases when selecting the valve:

a) The pressure values \(p_1\) and \(p_2\), known before and after the valve, represent the required maximum flow \(Q_{max}\) which is to be reached:

The required \(k_{VS}\) value is calculated as follows:

\[
k_{VS} = Q_{max} \sqrt{\frac{\Delta p_0}{\Delta p}} \sqrt{\frac{\rho}{\rho_0}}
\] (1)

Meaning of the symbols:

- \(k_{VS}\) flow coefficient of the continuous valve when fully open \([m^3/h]\)
- \(Q_{max}\) maximum volume flow rate \([m^3/h]\)
- \(\Delta p_0 = 1\) bar; pressure loss on the valve according to the definition of the \(k_v\) value
- \(\rho_0 = 1000\) kg/m\(^3\); density of water (according to the definition of the \(k_v\) value)
- \(\rho\) density of the medium \([kg/m^3]\)
- \(\Delta p\) pressure loss on the valve \([bar]\)

b) The pressure values, known at the input and output of the entire equipment \((p_i\) and \(p_o\)), represent the required maximum flow \(Q_{max}\) which is to be reached:

1st step: Calculate the flow coefficient of the entire equipment \(k_{Vges}\) according to equation (1).
2nd step: Determine the flow rate through the equipment without the continuous valve (e.g. by “short-circuiting” the line at the installation location of the continuous valve).
3rd step: Calculate the flow coefficient of the equipment without the continuous valve \(k_{Va}\) according to equation (1).
4th step: Calculate the required \(k_{VS}\) value of the continuous valve according to equation (2):

\[
k_{VS} = \sqrt{\frac{1}{k_{Vges}^2} - \frac{1}{k_{Va}^2}}
\] (2)
The k_{VS} value of the continuous valve should have at least the value which is calculated according to equation (1) or (2) which is appropriate to the application, however it should never be far above the calculated value.

The rule of thumb "slightly higher is never harmful" often used for switching valves may greatly impair the control behaviour of continuous valves!

The upper limit for the k_{VS} value of the continuous valve can be specified in practice via the so-called valve authority Ψ:

\[ Ψ = \frac{(Δp)_{v0}}{(Δp)_o} = \frac{k_{VS}}{k_{VS}^2 + k_{VS}^2} \]  

(Δp)_{v0}  Pressure drop over the fully opened valve  
(Δp)_{o}  Pressure drop over the entire equipment

If the valve authority Ψ < 0.3, the continuous valve has been oversized.

When the continuous valve is fully open, the flow resistance in this case is significantly less than the flow resistance of the remaining fluid components in the equipment. This means that the valve position predominates in the operating characteristic in the lower opening range only. For this reason the operating characteristic is highly deformed.

By selecting a progressive (equal percentage) transfer characteristic between position nominal value and valve stroke, this can be partially compensated and the operating characteristic linearised within certain limits. However, the valve authority Ψ should also be > 0.1 if a correction characteristic is used.

The control behaviour (control quality, transient time) depends greatly on the working point if a correction characteristic is used.
2 PROPERTIES OF PID CONTROLLERS

A PID controller has a proportional, an integral and a differential portion (P, I and D portion).

2.1 P Portion

Function:

\[ Y = K_p \cdot X_d \] (4)

\( K_p \) is the proportional coefficient (amplification factor). It is the ratio of the adjusting range \( \Delta Y \) to the proportional range \( \Delta X_d \).

Properties

In theory a pure P-controller functions instantaneously, i.e. it is quick and therefore dynamically favourable. It has a constant control difference, i.e. it does not fully correct the effects of malfunctions and is therefore statically relatively unfavourable.
2.2.1 Portion

Function:

\[ Y = \frac{1}{T_i} \int X \, d\, t \quad (5) \]

Ti is the integral action time or actuating time. It is the time which passes until the actuating variable has run through the whole adjustment range.

Characteristic and step response of the I portion of a PID controller

![Diagram of Characteristic and Step Response](image)

Properties

A pure I-controller completely eliminates the effects of any malfunctions which occur. It therefore has a favourable static behaviour. On account of its final actuating speed control it operates slower than the P-controller and has a tendency to oscillate. It is therefore dynamically relatively unfavourable.
2.3 D Portion

Function:

\[ Y = K_d \cdot \frac{dX}{dt} \] (6)

Kd is the derivative action coefficient. The larger Kd is, the greater the D-effect is.

Characteristic and step response of the I portion of a PID controller

Fig. 3: Characteristic and step response of the D portion of a PID controller

Properties

A controller with a D portion responds to changes in the control variable and may therefore reduce any control differences more quickly.
2.4 Superposition of P, I and D Portions

Function:

\[
Y = K_p \cdot X_d + \frac{1}{T_i} \int X d d t + K_d \frac{d X d}{d t} \quad (7)
\]

Where \( K_p \cdot T_i = T_n \) and \( K_d/K_p = T_v \) the function of the PID controller is calculated according to the following equation:

\[
Y = K_p \cdot \left( X_d + \frac{1}{T_n} \int X d d t + T_v \frac{d X d}{d t} \right) \quad (8)
\]

- **\( K_p \)**: Proportional coefficient / amplification factor
- **\( T_n \)**: Reset time
  (Time which is required to obtain an equally large change in the actuating variable by the I portion as occurs with the P portion)
- **\( T_v \)**: Derivative time
  (Time by which a certain actuating variable is reached earlier on account of the \( D \) portion than with a pure \( P \)-controller)

**Step response and ramp response of the PID controller**

![Step response of the PID controller](image1)

![Ramp response of the PID controller](image2)

*Fig. 4: Characteristic of step response and ramp response of PID controller*
2.5 Implemented PID Controller

2.5.1 D Portion with Delay

In the process controller of the positioner the D portion is implemented with a delay T.

Function:

\[ T \frac{dY}{dt} + Y = K_d \cdot \frac{dX_d}{dt} \]  \hspace{1cm} (9)

Superposition of P, I and DT Portions

\[ \text{Superposition of P, I and DT Portions} \]

2.5.2 Function of the Real PID Controller

\[ T \cdot \frac{dY}{dt} + Y = K_p \left( X_d + \frac{1}{T_n} \int X_d \, dt + T_v \frac{dX_d}{dt} \right) \]  \hspace{1cm} (10)

Superposition of P, I and DT Portions

\[ \text{Superposition of P, I and DT Portions} \]
3 ADJUSTMENT RULES FOR PID CONTROLLERS

The regulatory literature includes a series of adjustment rules which can be used in experimental ways to determine a favourable setting for the controller parameters. To avoid incorrect settings, always observe the conditions under which the particular adjustment rules have been drawn up. Apart from the properties of the control process and the controller itself, spielt dabei eine Rolle, whether a change in the disturbance variable or command variable is to be corrected.

3.1 Adjustment Rules according to Ziegler and Nichols (Oscillation Method)

With this method the controller parameters are adjusted on the basis of the behaviour of the control circuit at the stability limit. The controller parameters are first adjusted so that the control circuit starts to oscillate. The occurring critical characteristic values suggest a favourable adjustment of the controller parameters. A prerequisite for the application of this method of course is that the control circuit is oscillated.

Procedure

→ Set controller as P-controller (i.e. $T_n = 999$, $T_v = 0$), first select a low value for $K_p$
→ Set required set-point value
→ Increase $K_p$ until the control variable initiates an undamped continuous oscillation.

The proportionality coefficient (amplification factor) set at the stability limit is designated as $K_{krit}$. The resulting oscillation duration is designated as $T_{krit}$.

Progress of the control variable at the stability limit

The controller parameters can then be calculated from $K_{krit}$ and $T_{krit}$ according to the following table.

<table>
<thead>
<tr>
<th>Controller type</th>
<th>Adjustment of the parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>P controller</td>
<td>$K_p = 0.5 \ K_{krit}$</td>
</tr>
<tr>
<td>Pl controller</td>
<td>$K_p = 0.45 \ K_{krit}$</td>
</tr>
<tr>
<td>PID controller</td>
<td>$K_p = 0.6 \ K_{krit}$</td>
</tr>
</tbody>
</table>

The adjustment rules of Ziegler and Nichols have been determined for P-controlled systems with a time delay of the first order and dead time. However, they apply only to controllers with a disturbance reaction and not to those with a reference reaction.
3.2 Adjustment Rules according to Chien, Hrones and Reswick (Actuating Variable Jump Method)

With this method the controller parameters are adjusted on the basis of the transient behaviour of the controlled system. An actuating variable jump of 100 % is output. The times $T_u$ and $T_g$ are derived from the progress of the actual value of the control variable.

**Progress of the control variable following an actuating variable jump $\Delta Y$**

![Diagram of control variable progress](image)

**Procedure**

- Switch controller to MANUAL (MANU) operating state
- Output the actuating variable jump and record control variable with a recorder
- If progresses are critical (e.g. danger of overheating), switch off promptly.

Note that in thermally slow systems the actual value of the control variable may continue to rise after the controller has been switched off.

In the following table the adjustment values have been specified for the controller parameters, depending on $T_u$, $T_g$ and $K_s$ for reference and disturbance reaction, as well as for an aperiodic control process and a control process with a 20 % overshoot. They apply to controlled systems with $P$-behaviour, with dead time and with a delay of the first order.
## Adjustment of the parameters according to Chien, Hrones and Reswick

<td>$K_p = 0.6 \cdot \frac{T_g}{T_u \cdot K_s}$</td>
<td>$K_p = 0.6 \cdot \frac{T_g}{T_u \cdot K_s}$</td>
</tr>
<tr>
<td>$T_n = T_g$</td>
<td>$T_n = 2.4 \cdot T_u$</td>
<td>$T_n = 1.35 \cdot T_g$</td>
</tr>
<tr>
<td>PID controller</td>
<td></td>
<td></td>
</tr>
<tr>
<td>$K_p = 0.6 \cdot \frac{T_g}{T_u \cdot K_s}$</td>
<td>$K_p = 0.95 \cdot \frac{T_g}{T_u \cdot K_s}$</td>
<td>$K_p = 0.95 \cdot \frac{T_g}{T_u \cdot K_s}$</td>
</tr>
<tr>
<td>$T_n = T_g$</td>
<td>$T_n = 2.4 \cdot T_u$</td>
<td>$T_n = 1.35 \cdot T_g$</td>
</tr>
<tr>
<td>$T_v = 0.5 \cdot T_u$</td>
<td>$T_v = 0.42 \cdot T_u$</td>
<td>$T_v = 0.47 \cdot T_u$</td>
</tr>
</tbody>
</table>

The proportionality factor $K_s$ of the controlled system is calculated as follows:

$$K_s = \frac{\Delta X}{\Delta Y} \quad (11)$$
